# Intel® MPI Library Developer Reference for Linux\* OS

---

Documentation for older versions of the Intel® MPI Library are available for download only. For a list of available documentation downloads by product version, see [Download Documentation for Intel Parallel Studio XE](#). To download the previous versions of Intel MPI Library documentation, refer to [this page](#).

## What's New

This *Developer Reference* provides you with the complete reference for the Intel® MPI Library. It is intended to help a user fully utilize the Intel MPI Library functionality. For examples and detailed functionality description, please refer to the Intel MPI Library Developer Guide.

The following are some popular topics in the Intel MPI Library Developer Reference:

### Command Reference

[Command Reference](#) provides reference information on compilation and runtime commands ([mpirun](#), [cpuinfo](#), [impi\\_info](#)) and describes how to use these commands.

### Environment Variable Reference

[Environment Variable Reference](#) provides syntax, arguments, and descriptions for [Fabrics Control](#), [Tuning](#), [Autotuning](#), [Process Pinning](#), and [I\\_MPI\\_ADJUST Family](#) environment variables.

### Global Options and Environment Variables for `mpiexec.hydra`

Describes the [Global Options](#) and provides [Environment Variables](#) used with the Hydra process manager.

### Mpitune Configuration Options

Tune your MPI application with the [mpitune](#) utility.

---

# Introduction

---

This *Developer Reference* provides you with the complete reference for the Intel® MPI Library. It is intended to help an experienced user fully utilize the Intel MPI Library functionality. You can freely redistribute this document in any desired form.

## Document Organization

Section	Description
<b>Section 1.</b> <a href="#">Introduction</a>	Introduces this document and the Intel MPI Library.
<b>Section 2.</b> <a href="#">Command Reference</a>	Describes compilation and job startup commands and their options.
<b>Section 3.</b> <a href="#">Environment Variable Reference</a>	Describes environment variables .
<b>Section 4.</b> <a href="#">Miscellaneous</a>	Contains information not related to the sections above.

## Introducing Intel® MPI Library

---

Intel® MPI Library is a multi-fabric message passing library that implements the Message Passing Interface, v3.1 (MPI-3.1) specification. It provides a standard library across Intel® platforms that enable adoption of MPI-3.1 functions as their needs dictate.

Intel® MPI Library enables developers to change or to upgrade processors and interconnects as new technology becomes available without changes to the software or to the operating environment.

You can get the latest information for the Intel® MPI Library at <https://software.intel.com/intel-mpi-library>.

## What's New

---

This page lists changes to the product that are reflected in the documentation. For a list of all changes, refer to the [Release Notes](#).

### Intel® oneAPI Gold

- No documentation changes.

### Intel oneAPI Beta 10

- Added Intel® Ethernet 800 Series support.
- Added MPI + OpenMP offload examples.
- Added new algorithm for MPI\_Sendrecv\_replace (I\_MPI\_ADJUST\_SENDRECV\_REPLACE=2).
- Added I\_MPI OFFLOAD variable to GPU Support topic.

### Intel oneAPI Beta 04 – 09

- No documentation changes.

### Intel oneAPI Beta 03

- Reworked directory layout:
  - Removed intel64/.
  - Mpivars.[c]sh and mpi modulefile moved to env/.
  - Mpivars.[c]sh renamed to vars.[c]sh.
- Removed deprecated symbolic links.
- Removed static libraries for debug configurations.

## Notational Conventions

---

The following conventions are used in this document.

<i>This type style</i>	Document or product names
This type style	Hyperlinks
This type style	Commands, arguments, options, file names
THIS_TYPE_STYLE	Environment variables
<this type style>	Placeholders for actual values
[ items ]	Optional items
{ item   item }	Selectable items separated by vertical bar(s)

## Related Information

---

### Description

of some of the Intel® MPI Library functionality is available in `man1` pages: `mpiexec.hydra`, `hydra_nameserver`, and compiler wrappers.

The following related documents that might be useful to the user:

- [Product Web Site](#)
- [Intel® MPI Library Support](#)
- [Intel® Cluster Tools Products](#)
- [Intel® Software Development Products](#)

---

# Command Reference

---

This section provides information on different command types and how to use these commands:

- [Compilation Commands](#) lists the available Intel® MPI Library compiler commands, related options, and environment variables.
- [mpirun](#) provides the description and examples for the `mpirun` command.
- [mpiexec.hydra](#) gives full information on the `mpiexec.hydra` command, its options, environment variables, and related features and utilities.
- [cpuinfo](#) provides the syntax, arguments, description and output examples for the `cpuinfo` utility.
- [impi\\_info](#) provides information on available environment variables.
- [mpitune](#) provides information on configuration options for the `mpitune` utility.

## Compiler Commands

---

The following table lists the available Intel® MPI Library compiler commands with their underlying compilers and programming languages.

### Intel® MPI Library Compiler Wrappers

Compiler Command	Default Compiler	Supported Language(s)
Generic Compilers		
mpicc	gcc, cc	C
mpicxx	g++	C/C++
mpifc	gfortran	Fortran77*/Fortran 95*
GNU* Compilers		
mpigcc	gcc	C
mpigxx	g++	C/C++
mpif77	gfortran	Fortran 77
mpif90	gfortran	Fortran 95
Intel® Fortran, C++ Compilers		
mpiicc	icc	C
mpiicpc	icpc	C++
mpiifort	ifort	Fortran77/Fortran 95

#### NOTES:

- Compiler commands are available only in the Intel® MPI Library Software Development Kit (SDK).
- For the supported versions of the listed compilers, refer to the *Release Notes*.
- Compiler wrapper scripts are located in the `<install-dir>/bin` directory, where `<install-dir>` is the Intel® MPI Library installation directory.
- The environment settings can be established by sourcing the `<install-dir>/env/vars.[c]sh` script. To use a specific library configuration, pass one of the following arguments to the script to switch to the corresponding configuration: `release`, `debug`, `release_mt`, or `debug_mt`. The ordinary multi-threaded optimized library is chosen by default. Alternatively, you can use the `I_MPI_LIBRARY_KIND` environment variable to specify a configuration and source the script without arguments.
- Ensure that the corresponding underlying compiler is already in your `PATH`. If you use the Intel® compilers, source the `vars.sh` script from the installation directory to set up the compiler environment.
- To display mini-help of a compiler command, execute it without any parameters.

## Compilation Command Options

### -nostrip

Use this option to turn off the debug information stripping while linking the Intel® MPI Library statically.

**-config=<name>**

Use this option to source a compiler configuration file. The file should contain the environment settings to be used with the specified compiler.

Use the following naming convention for configuration files:

```
<install-dir>/etc/mpi<compiler>-<name>.conf
```

where:

- **<compiler>**={cc,cxx,f77,f90}, depending on the language compiled.
- **<name>** is the name of the underlying compiler with spaces replaced by hyphens; for example, the **<name>** value for cc -64 is cc--64.

**-profile=<profile\_name>**

Use this option to specify an MPI profiling library. **<profile\_name>** is the name of the configuration file (profile) that loads the corresponding profiling library. The profiles are taken from **<install-dir>/etc** .

The Intel MPI Library comes with several predefined profiles for the Intel® Trace Collector:

- **<install-dir>/etc/vt.conf** — regular tracing library
- **<install-dir>/etc/vtfs.conf** — fail-safe tracing library
- **<install-dir>/etc/vtmc.conf** — correctness checking tracing library
- **<install-dir>/etc/vtim.conf** — load imbalance tracing library

You can also create your own profile as **<profile-name>.conf**. You can define the following environment variables in a configuration file:

- **PROFILE\_PRELIB** - libraries (and paths) to load before the Intel MPI Library
- **PROFILE\_POSTLIB** - libraries to load after the Intel MPI Library
- **PROFILE\_INCPATHS** - C preprocessor arguments for any include files

For example, create a file **myprof.conf** with the following lines:

```
PROFILE_PRELIB="-L<path_to_myprof>/lib -lmyprof"
PROFILE_INCPATHS="-I<paths_to_myprof>/include"
```

Use the **-profile=myprof** option for the relevant compiler wrapper to select this new profile.

**-t or -trace**

Use the **-t** or **-trace** option to link the resulting executable file against the Intel® Trace Collector library. Using this option has the same effect as the **-profile=vt** option.

You can also use the **I\_MPI\_TRACE\_PROFILE** environment variable to **<profile\_name>** to specify another profiling library. For example, set **I\_MPI\_TRACE\_PROFILE** to **vtfs** to link against the fail-safe version of the Intel Trace Collector.

To use this option, include the installation path of the Intel® Trace Collector in the **VT\_ROOT** environment variable. Source the **vars.[c]sh** script provided in the Intel® Trace Analyzer and Collector installation folder.

**-trace-imbalance**

Use the **-trace-imbalance** option to link the resulting executable file against the load imbalance tracing library of Intel Trace Collector. Using this option has the same effect as the **-profile=vtim** option.

To use this option, include the installation path of the Intel Trace Collector in the **VT\_ROOT** environment variable. Source the **vars.[c]sh** script provided in the Intel® Trace Analyzer and Collector installation folder.

---

### **-check\_mpi**

Use this option to link the resulting executable file against the Intel® Trace Collector correctness checking library. The default value is `libVTmc.so`. Using this option has the same effect as the `-profile=vtmc` option.

You can also use the `I_MPI_CHECK_PROFILE` environment variable to *<profile\_name>* to specify another checking library.

To use this option, include the installation path of the Intel Trace Collector in the `VT_ROOT` environment variable. Source the `vars.[c]sh` script provided in the Intel® Trace Analyzer and Collector installation folder.

### **-ilp64**

Use this option to enable partial ILP64 support. All integer arguments of the Intel MPI Library are treated as 64-bit values in this case.

### **-no\_ilp64**

Use this option to disable the ILP64 support explicitly. This option must be used in conjunction with `-i8` option of Intel® Fortran Compiler.

If you specify the `-i8` option for the separate compilation with Intel Fortran Compiler, you still have to use the `i8 orilp64` option for linkage.

### **-dynamic\_log**

Use this option in combination with the `-t` option to link the Intel Trace Collector library dynamically. This option does not affect the default linkage method for other libraries.

To run the resulting programs, include `$VT_ROOT/slib` in the `LD_LIBRARY_PATH` environment variable.

### **-g**

Use this option to compile a program in debug mode and link the resulting executable file against the debugging version of the Intel MPI Library. See `I_MPI_DEBUG` for information on how to use additional debugging features with the `-g` builds.

The optimized library is linked with the `-g` option by default.

Use `vars.{sh|csh} [debug|debug_mt]` at runtime to load a particular `libmpi.so` configuration.

### **-link\_mpi=<arg>**

Use this option to always link the specified version of the Intel MPI Library. See the `I_MPI_LINK` environment variable for detailed argument descriptions. This option overrides all other options that select a specific library .

Use `vars.{sh|csh}[debug|debug_mt]` during runtime to load particular `libmpi.so` configuration.

### **-O**

Use this option to enable compiler optimization.

### **-fast**

Use this option to maximize speed across the entire program. This option forces static linkage method for the Intel MPI Library.

This option is supported only by the `mpiicc`, `mpiicpc`, and `mpiifort` Intel® compiler wrappers.

### **-echo**

Use this option to display everything that the command script does.

### **-show**

Use this option to learn how the underlying compiler is invoked, without actually running it. Use the following command to see the required compiler flags and options:

```
$ mpiicc -show -c test.c
```

Use the following command to see the required link flags, options, and libraries:

```
$ mpiicc -show -o a.out test.o
```

This option is particularly useful for determining the command line for a complex build procedure that directly uses the underlying compilers.

### **-show\_env**

Use this option to see the environment settings in effect when the underlying compiler is invoked.

### **-{cc,cxx,fc}=<compiler>**

Use this option to select the underlying compiler. The tables below list the available LLVM and IL0 compiler options and commands used to invoke them.

#### **LLVM Compiler Options for Intel® oneAPI**

Language	Product Name	Compiler Driver	Compiler Wrapper	Command	Example
C	>Intel® oneAPI DPC++/C++ Compiler	icx	mpiicc	-cc=icx	\$ mpiicc -cc=icx -c test.c
C++	Intel® oneAPI DPC++/C++ C	icpx	mpiicpc	-cxx=icpx	\$ mpiicpc -cxx=icpx -c test.cpp
DPC++	Intel® oneAPI DPC++/C++ Compiler	dpcpp	mpiicpc	-cxx=dpcpp	\$ mpiicpc -cxx=dpcpp -c test.cpp
Fortran	Intel® oneAPI Fortran Compiler	ifx	mpiifort	-fc=ifx	\$ mpiifort -fc=ifx -c test.

#### **IL0 Compiler Options for Intel® Parallel Studio Extended Edition**

Language	Product Name	Compiler Driver	Compiler Wrapper	Example
C	Intel® C++ Compiler Classic	icc	mpiicc	\$ mpiicc -c test.c
C++	Intel® C++ Compiler Classic	icpc	mpiicpc	\$ mpiicpc -c test.cpp
Fortran	Intel® Fortran Compiler Classic	ifort	mpiifort	\$ mpiifort -c test.f

---

**NOTE** Make sure that the wrapper name is in your `PATH`. Alternatively, you can specify the full path to the compiler.

---

#### **-nofortbind, -nofortran**

Use this option to disable `mpiicc` linking with Fortran bindings. This has the same effect as the `I_MPI_FORT_BIND` variable.

#### **-v**

Use this option to print the compiler wrapper script version and its underlying compiler version.

#### **-norpath**

Use this option to disable `rpath` for the compiler wrapper for the Intel® MPI Library.

## **mpirun**

---

Launches an MPI job and provides integration with job schedulers.

### **Syntax**

`mpirun <options>`

### **Arguments**

<code>&lt;options&gt;</code>	<code>mpiexec.hydra</code> options as described in the <code>mpiexec.hydra</code> section. This is the default operation mode.
------------------------------	--

### **Description**

Use this command to launch an MPI job. The `mpirun` command uses Hydra as the underlying process manager.

The `mpirun` command detects if the MPI job is submitted from within a session allocated using a job scheduler like Torque\*, PBS Pro\*, LSF\*, ParallelNavi\* NQS\*, Slurm\*, Univa\* Grid Engine\*, or LoadLeveler\*. The `mpirun` command extracts the host list from the respective environment and uses these nodes automatically according to the above scheme.

In this case, you do not need to create a host file. Allocate the session using a job scheduler installed on your system, and use the `mpirun` command inside this session to run your MPI job.

#### **Example**

```
$ mpirun -n <# of processes> ./myprog
```

This command invokes the `mpiexec.hydra` command (Hydra process manager), which launches the `myprog` executable.

## **mpiexec.hydra**

---

Launches an MPI job using the Hydra process manager.

## Syntax

```
mpiexec.hydra<g-options> <l-options> <executable>
```

or

```
mpiexec.hydra<g-options> <l-options> <executable1> : <l-options> <executable2>
```

## Arguments

<g-options>	Global options that apply to all MPI processes
<l-options>	Local options that apply to a single argument set
<executable>	./a.out or path/ name of the executable file

## Description

Use the `mpiexec.hydra` utility to run MPI applications using the Hydra process manager.

Use the first short command-line syntax to start all MPI processes of the <executable> with the single set of arguments. For example, the following command executes `a.out` over the specified processes and hosts:

```
$ mpiexec.hydra -f <hostfile> -n <# of processes> ./a.out
```

where:

- <# of processes> specifies the number of processes on which to run the `a.out` executable
- <hostfile> specifies a list of hosts on which to run the `a.out` executable

Use the second long command-line syntax to set different argument sets for different MPI program runs. For example, the following command executes two different binaries with different argument sets:

```
$ mpiexec.hydra -f <hostfile> -env <VAR1> <VAL1> -n 2 ./a.out : \
  -env <VAR2> <VAL2> -n 2 ./b.out
```

### NOTE

You need to distinguish global options from local options. In a command-line syntax, place the local options after the global options.

## Global Hydra Options

This section describes the global options of the Intel® MPI Library's Hydra process manager. Global options are applied to all arguments sets in the launch command. Argument sets are separated by a colon ':'.  
`-tune <filename>`

Use this option to specify the file name that contains the tuning data in a binary format.

`-usize <usize>`

Use this option to set `MPI_UNIVERSE_SIZE`, which is available as an attribute of the `MPI_COMM_WORLD`.

<size>	Define the universe size
SYSTEM	Set the size equal to the number of cores passed to <code>mpiexec</code> through the hostfile or the resource manager.
INFINITE	Do not limit the size. This is the default value.
<value>	Set the size to a numeric value $\geq 0$ .

`-hostfile <hostfile>` or `-f <hostfile>`

Use this option to specify host names on which to run the application. If a host name is repeated, this name is used only once.

See also the `I_MPI_HYDRA_HOST_FILE` environment variable for more details.

---

**NOTE**

Use the following options to change the process placement on the cluster nodes:

---

- Use the `-perhost`, `-ppn`, and `-grr` options to place consecutive MPI processes on every host using the round robin scheduling.
- Use the `-rr` option to place consecutive MPI processes on different hosts using the round robin scheduling.

`-machinefile <machine file>` or `-machine <machine file>`

Use this option to control process placement through a machine file. To define the total number of processes to start, use the `-n` option. For example:

```
$ cat ./machinefile
node0:2
node1:2
node0:1
```

`-hosts-group`

Use this option to set node ranges using brackets, commas, and dashes (like in Slurm\* Workload Manager). For more details, see the `I_MPI_HYDRA_HOST_FILE` environment variable in [Hydra Environment Variables](#).

`-silent-abort`

Use this option to disable abort warning messages.

For more details, see the `I_MPI_SILENT_ABORT` environment variable in [Hydra Environment Variables](#).

`-nameserver`

Use this option to specify the nameserver in the `hostname:port` format.

For more details, see the `I_MPI_HYDRA_NAMESERVER` environment variable in [Hydra Environment Variables](#).

`-genv <ENVVAR> <value>`

Use this option to set the `<ENVVAR>` environment variable to the specified `<value>` for all MPI processes.

`-genvall`

Use this option to enable propagation of all environment variables to all MPI processes.

`-genvnone`

Use this option to suppress propagation of any environment variables to any MPI processes.

---

**NOTE**

The option does not work for localhost.

`-genvexcl <list of env var names>`

Use this option to suppress propagation of the listed environment variables to any MPI processes.

`-genvlist <list>`

Use this option to pass a list of environment variables with their current values. `<list>` is a comma separated list of environment variables to be sent to all MPI processes.

`-pmi-connect <mode>`

Use this option to choose the caching mode of process management interface (PMI) message. Possible values for `<mode>` are:

---

<code>&lt;mode&gt;</code>	The caching mode to be used
<code>nocache</code>	Do not cache PMI messages.

---

cache	Cache PMI messages on the local <code>pmi_proxy</code> management processes to minimize the number of PMI requests. Cached information is automatically propagated to child management processes.
lazy-cache	cache mode with on-request propagation of the PMI information.
alltoall	Information is automatically exchanged between all <code>pmi_proxy</code> before any get request can be done. This is the default mode.

See the `I_MPI_HYDRA_PMI_CONNECT` environment variable for more details.

`-perhost <# of processes >`, `-ppn <# of processes >`, or `-grr <# of processes >`

Use this option to place the specified number of consecutive MPI processes on every host in the group using round robin scheduling. See the `I_MPI_PERHOST` environment variable for more details.

#### NOTE

When running under a job scheduler, these options are ignored by default. To be able to control process placement with these options, disable the `I_MPI_JOB_RESPECT_PROCESS_PLACEMENT` variable.

`-rr`

Use this option to place consecutive MPI processes on different hosts using the round robin scheduling. This option is equivalent to "`-perhost 1`". See the `I_MPI_PERHOST` environment variable for more details.

`-trace [<profiling_library>]` or `-t [<profiling_library>]`

Use this option to profile your MPI application with Intel® Trace Collector using the indicated `<profiling_library>`. If you do not specify `<profiling_library>`, the default profiling library `libVT.so` is used.

Set the `I_MPI_JOB_TRACE_LIBS` environment variable to override the default profiling library.

`-trace-imbalance`

Use this option to profile your MPI application with Intel® Trace Collector using the `libVTim.so` library.

`-aps`

Use this option to collect statistics from your MPI application using Application Performance Snapshot. The collected data includes hardware performance metrics, memory consumption data, internal MPI imbalance and OpenMP\* imbalance statistics. When you use this option, a new folder `aps_result_<date>-<time>` with statistics data is generated. You can analyze the collected data with the `aps` utility, for example:

```
$ mpirun -aps -n 2 ./myApp
$ aps aps_result_20171231_235959
```

#### NOTE

1. To use this option, set up the Application Performance Snapshot environment beforehand. See the tool's *Getting Started Guide* at `<installdir>/performance_snapshot` in Intel® Parallel Studio XE Professional or Cluster Edition.
2. If you use the options `-trace` or `-check_mpi`, the `-aps` option is ignored.

`-mps`

---

Use this option to collect only MPI and OpenMP\* statistics from your MPI application using Application Performance Snapshot. Unlike the `-aps` option, `-mps` doesn't collect hardware metrics. The option is equivalent to:

```
$ mpirun -n 2 aps -c mpi,omp ./myapp
```

#### `-trace-pt2pt`

Use this option to collect the information about point-to-point operations using Intel® Trace Analyzer and Collector. The option requires that you also use the `-trace` option.

#### `-trace-collectives`

Use this option to collect the information about collective operations using Intel® Trace Analyzer and Collector. The option requires that you also use the `-trace` option.

---

#### **NOTE**

Use the `-trace-pt2pt` and `-trace-collectives` to reduce the size of the resulting trace file or the number of message checker reports. These options work with both statically and dynamically linked applications.

#### `-configfile <filename>`

Use this option to specify the file `<filename>` that contains the command-line options with one executable per line. Blank lines and lines that start with '#' are ignored. Other options specified in the command line are treated as global.

You can specify global options in configuration files loaded by default (`mpiexec.conf` in `<installdir>/etc`, `~/mpiexec.conf`, and `mpiexec.conf` in the working directory). The remaining options can be specified in the command line.

#### `-branch-count <num>`

Use this option to restrict the number of child management processes launched by the Hydra process manager, or by each `pmi_proxy` management process.

See the [I\\_MPI\\_HYDRA\\_BRANCH\\_COUNT](#) environment variable for more details.

#### `-pmi-aggregate` or `-pmi-noaggregate`

Use this option to switch on or off, respectively, the aggregation of the PMI requests. The default value is `-pmi-aggregate`, which means the aggregation is enabled by default.

See the [I\\_MPI\\_HYDRA\\_PMIAggregate](#) environment variable for more details.

#### `-gdb`

Use this option to run an executable under GDB\* (GNU debugger). You can use the following command:

---

```
$ mpiexec.hydra -gdb -n <# of processes><executable>
```

#### `-gdba <pid>`

Use this option to attach the GNU\* debugger to the existing MPI job. You can use the following command:

```
$ mpiexec.hydra -gdba <pid>
```

#### `-nolocal`

Use this option to avoid running the `<executable>` on the host where `mpiexec.hydra` is launched. You can use this option on clusters that deploy a dedicated main node for starting the MPI jobs and a set of dedicated compute nodes for running the actual MPI processes.

**-hosts <nodelist>**

Use this option to specify a particular <nodelist> on which the MPI processes should be run. For example, the following command runs the executable `a.out` on the hosts `host1` and `host2`:

```
$ mpiexec.hydra -n 2 -ppn 1 -hosts host1,host2 ./a.out
```

#### NOTE

If <nodelist> contains only one node, this option is interpreted as a local option. See [Local Options](#) for details.

**-iface <interface>**

Use this option to choose the appropriate network interface. For example, if the IP emulation of your InfiniBand\* network is configured to `ib0`, you can use the following command.

```
$ mpiexec.hydra -n 2 -iface ib0 ./a.out
```

See the `I_MPI_HYDRA_IFACE` environment variable for more details.

**-demux <mode>**

Use this option to set the polling mode for multiple I/O. The default value is `poll`.

### Arguments

<spec>	Define the polling mode for multiple I/O
<code>poll</code>	Set <code>poll</code> as the polling mode. This is the default value.
<code>select</code>	Set <code>select</code> as the polling mode.

See the `I_MPI_HYDRA_DEMUX` environment variable for more details.

**-enable-x or -disable-x**

Use this option to control the Xlib\* traffic forwarding. The default value is `-disable-x`, which means the Xlib traffic is not forwarded.

**-l, -prepend-rank**

Use this option to insert the MPI process rank at the beginning of all lines written to the standard output.

**-ilp64**

Use this option to preload the ILP64 interface.

**-s <spec>**

Use this option to direct standard input to the specified MPI processes.

### Arguments

<spec>	Define MPI process ranks
<code>all</code>	Use all processes.
<code>none</code>	Do not direct standard output to any processes.
<l>, <m>, <n>	Specify an exact list and use processes <l>, <m> and <n> only. The default value is zero.
<k>, <l>-<m>, <n>	Specify a range and use processes <k>, <l> through <m>, and <n>.

**-noconf**

---

Use this option to disable processing of the `mpiexec.hydra` configuration files.

`-ordered-output`

Use this option to avoid intermingling of data output from the MPI processes. This option affects both the standard output and the standard error streams.

---

**NOTE**

When using this option, end the last output line of each process with the end-of-line '\n' character. Otherwise the application may stop responding.

`-path <directory>`

Use this option to specify the path to the executable file.

`-tmpdir <dir>`

Use this option to set a directory for temporary files. See the [I\\_MPI\\_TMPDIR](#) environment variable for more details.

`-version` or `-V`

Use this option to display the version of the Intel® MPI Library.

`-info`

Use this option to display build information of the Intel® MPI Library. When this option is used, the other command line arguments are ignored.

`-localhost`

Use this option to explicitly specify the local host name for the launching node.

`-rmk <RMK>`

Use this option to select a resource management kernel to be used. Intel® MPI Library only supports `pbs`.

See the [I\\_MPI\\_HYDRA\\_RMK](#) environment variable for more details.

`-outfile-pattern <file>`

Use this option to redirect `stdout` to the specified file.

`-errfile-pattern <file>`

Use this option to redirect `stderr` to the specified file.

`-gpath <path>`

Use this option to specify the path to the executable file.

`-gwdir <dir>`

Use this option to specify the working directory in which the executable file runs.

`-gumask <umask>`

Use this option to perform the "`umask <umask>`" command for the remote executable file.

`-gdb-ia`

Use this option to run processes under Intel® architecture specific GNU\* debugger.

`-prepend-pattern`

Use this option to specify the pattern that is prepended to the process output.

---

`-verbose` or `-v`

Use this option to print debug information from `mpiexec.hydra`, such as:

- Service processes arguments
- Environment variables and arguments passed to start an application
- PMI requests/responses during a job life cycle

See the `I_MPI_HYDRA_DEBUG` environment variable for more details.

`-print-rank-map`

Use this option to print out the MPI rank mapping.

`-print-all-exitcodes`

Use this option to print the exit codes of all processes.

`-bootstrap <bootstrap server>`

Use this option to select a built-in bootstrap server to use. A bootstrap server is the basic remote node access mechanism that is provided by the system. Hydra supports multiple runtime bootstrap servers such as `ssh`, `rsh`, `pdsh`, `fork`, `persist`, `slurm`, `ll`, `lsf`, or `sge` to launch MPI processes. The default bootstrap server is `ssh`. By selecting `slurm`, `ll`, `lsf`, or `sge`, you use the corresponding `srun`, `llspawn.stdio`, `blaunch`, or `qrsh` internal job scheduler utility to launch service processes under the respective selected job scheduler (Slurm\*, LoadLeveler\*, LSF\*, and SGE\*).

## Arguments

<code>&lt;arg&gt;</code>	String parameter
<code>ssh</code>	Use secure shell. This is the default value.
<code>rsh</code>	Use remote shell.
<code>pdsh</code>	Use parallel distributed shell.
<code>pbsdsh</code>	Use Torque* and PBS* <code>pbsdsh</code> command.
<code>fork</code>	Use fork call.
<code>persist</code>	Use Hydra persist server. See below for details.
<code>slurm</code>	Use Slurm* <code>srun</code> command.
<code>ll</code>	Use LoadLeveler* <code>llspawn.stdio</code> command.
<code>lsf</code>	Use LSF <code>blaunch</code> command.
<code>sge</code>	Use Univa* Grid Engine* <code>qrsh</code> command.

See `I_MPI_HYDRA_BOOTSTRAP` for details.

`-bootstrap-exec <bootstrap server>`

Use this option to set the executable to be used as a bootstrap server. The default bootstrap server is `ssh`. For example:

```
$ mpiexec.hydra -bootstrap-exec <bootstrap_server_executable> -f hosts -env <VAR1> <VAL1> -n 2 ./a.out
```

See `I_MPI_HYDRA_BOOTSTRAP` for more details.

`-bootstrap-exec-args <args>`

Use this option to provide the additional parameters to the bootstrap server executable file.

```
$ mpiexec.hydra -bootstrap-exec-args <arguments> -n 2 ./a.out
```

For tight integration with the Slurm\* scheduler (including support for suspend/resume), use the method outlined on the Slurm page here: [http://www.schedmd.com/slurmdocs/mpi\\_guide.html#intel\\_mpi](http://www.schedmd.com/slurmdocs/mpi_guide.html#intel_mpi)

See `I_MPI_HYDRA_BOOTSTRAP_EXEC_EXTRA_ARGS` for more details.

---

-v6

Use this option to force using the IPv6 protocol.

## Local Hydra Options

This section describes the local options of the Intel® MPI Library's Hydra process manager. Local options are applied only to the argument set they are specified in. Argument sets are separated by a colon ':'.

-n <# of processes> or -np <# of processes>

Use this option to set the number of MPI processes to run with the current argument set.

-env <ENVVAR> <value>

Use this option to set the <ENVVAR> environment variable to the specified <value> for all MPI processes in the current argument set.

-envall

Use this option to propagate all environment variables in the current argument set. See the [I\\_MPI\\_HYDRA\\_ENV](#) environment variable for more details.

-envnone

Use this option to suppress propagation of any environment variables to the MPI processes in the current argument set.

---

### NOTE

The option does not work for localhost.

-envexcl <list of env var names>

Use this option to suppress propagation of the listed environment variables to the MPI processes in the current argument set.

-envlist <list>

Use this option to pass a list of environment variables with their current values. <list> is a comma separated list of environment variables to be sent to the MPI processes.

-host <nodename>

Use this option to specify a particular <nodename> on which the MPI processes are to be run. For example, the following command executes `a.out` on hosts `host1` and `host2`:

---

```
$ mpiexec.hydra -n 2 -host host1 ./a.out : -n 2 -host host2 ./a.out
```

-path <directory>

Use this option to specify the path to the <executable> file to be run in the current argument set.

-wdir <directory>

Use this option to specify the working directory in which the <executable> file runs in the current argument set.

## gtool Options

-gtool

Use this option to launch such tools as Intel® VTune™ Amplifier XE, Intel® Advisor, Valgrind\*, and the GDB\* (GNU Debugger) for the specified processes through the `mpiexec.hydra` and `mpirun` commands. An alternative to this option is the [I\\_MPI\\_GTOOL](#) environment variable.

## Syntax

```
-gtool "<command line for tool 1>:<ranks set 1>[=launch mode 1][@arch 1]; <command line for tool 2>:<ranks set 2>[=exclusive][@arch 2]; ... ;<command line for a tool n>:<ranks set n>[=exclusive][@arch n]" <executable>
```

or:

```
$ mpirun -n <# of processes> -gtool "<command line for tool 1>:<ranks set 1>[=launch mode 1][@arch 1]" -gtool "<command line for a tool 2>:<ranks set 2>[=launch mode 2][@arch 2]" ... -gtool "<command line for a tool n>:<ranks set n>[=launch mode 3][@arch n]" <executable>
```

In the syntax, the separator ';' and the `-gtool` option are interchangeable.

## Arguments

<code>&lt;arg&gt;</code>	Parameters
<code>&lt;rank set&gt;</code>	Specify the range of ranks that are involved in the tool execution. Separate ranks with a comma or use the '-' symbol for a set of contiguous ranks. To run the tool for all ranks, use the <code>all</code> argument.
	<b>NOTE</b> If you specify incorrect rank index, the corresponding warning is printed and the tool continues working for valid ranks.
<code>[=launch mode]</code>	Specify the launch mode (optional). See below for the available values.
<code>[@arch]</code>	Specify the architecture on which the tool runs (optional). For a given <code>&lt;rank set&gt;</code> , if you specify this argument, the tool is launched only for the processes residing on hosts with the specified architecture. This parameter is optional.

### NOTE

Rank sets cannot overlap for the same `@arch` parameter. Missing `@arch` parameter is also considered a different architecture. Thus, the following syntax is considered valid:

```
-gtool "gdb:0-3=attach;gdb:0-3=attach@hsw;/usr/bin/gdb:0-3=attach@knl"
```

Also, note that some tools cannot work together or their simultaneous use may lead to incorrect results.

The following table lists the parameter values for `[=launch mode]`:

<code>[=launch mode]</code>	Tool launch mode (optional). You can specify several values for each tool, which are separated with a comma ','.
<code>exclusive</code>	Specify this value to prevent the tool from launching for more than one rank per host.

<i>attach</i>	Specify this value to attach the tool from <code>-gtool</code> to the executable. If you use debuggers or other tools that can attach to a process in a debugger manner, you need to specify this value. This mode has been tested with debuggers only.
<i>node-wide</i>	Specify this value to apply the tool from <code>-gtool</code> to all ranks where the <code>&lt;rank set&gt;</code> resides or for all nodes in the case of <code>all</code> ranks. That is, the tool is applied to a higher level than the executable (to the <code>pmi_proxy</code> daemon).  Use the <code>-remote</code> argument for ranks to use the tool on remote nodes only.

#### NOTE

The tool attached to an MPI process may be executed without having access to stdin. To pass input to it, run a rank under the tool directly, for example: `-gtool "gdb --args:0"`

## Examples

The following examples demonstrate different scenarios of using the `-gtool` option.

### Example 1

Launch the Intel® VTune™ Amplifier XE and Valgrind\* through the `mpirun` command:

```
$ mpirun -n 16 -gtool "amplxe-cl -collect hotspots -analyze-system \
-r result1:5,3,7-9=exclusive@bdw;valgrind -log-file=log_%p:0,1,10-12@hsw" a.out
```

This command launches `amplxe-cl` for the processes that are run on the Intel® microarchitecture codenamed Broadwell. Only one copy of `amplxe-cl` is launched for each host, the process with the minimal index is affected. At the same time, Valgrind\* is launched for all specified processes that are run on the Intel® microarchitecture codenamed Haswell. Valgrind's results are saved to the files `log_<process ID>`.

### Example 2

Set different environment variables for different rank sets:

```
$ mpirun -n 16 -gtool "env VARIABLE1=value1 VARIABLE2=value2:3,5,7-9; env VARIABLE3=value3:0,11"
a.out
```

### Example 3

Apply a tool for a certain process through the `-machinefile` option.

In this example, suppose `m_file` has the following content:

```
$ cat ./m_file
hostname_1:2
hostname_2:3
hostname_3:1
```

The following command line demonstrates how to use the `-machinefile` option to apply a tool:

```
$ mpirun -n 6 -machinefile m_file -gtool "amplxe-cl -collect hotspots -analyze-system \
-r result1:5,3=exclusive@hsw;valgrind:0,1@bdw" a.out
```

In this example, the use of `-machinefile` option means that processes with indices 0 and 1 are located on the `hostname_1` machine, process 3 is located on the `hostname_2` machine, and process 5 - on the `hostname_3` machine. After that, `amplxe-cl` is applied only ranks 3 and 5 (since these ranks belong to different machines, the `exclusive` option matches both of them) in case if `hostname_2` and `hostname_3` machines have Intel® microarchitecture codenamed Haswell. At the same time, the Valgrind\* tool is applied to both ranks allocated on `hostname_1` machine in case if it has Intel® microarchitecture codenamed Broadwell.

`-gtoolfile <gtool_config_file>`

Use this option to specify the `-gtool` parameters in a configuration file. All the same rules apply. Additionally, you can separate different command lines with section breaks.

For example, if `gtool_config_file` contains the following settings:

```
env VARIABLE1=value1 VARIABLE2=value2:3,5,7-9; env VARIABLE3=value3:0,11
env VARIABLE4=value4:1,12
```

The following command sets `VARIABLE1` and `VARIABLE2` for processes 3, 5, 7, 8, and 9 and sets `VARIABLE3` for processes 0 and 11, while `VARIABLE4` is set for processes 1 and 12:

```
$ mpirun -n 16 -gtoolfile gtool_config_file a.out
```

#### NOTE

The options and the environment variable `-gtool`, `-gtoolfile` and `I_MPI_GTOOL` are mutually exclusive. The options `-gtool` and `-gtoolfile` are of the same priority and have higher priority than `I_MPI_GTOOL`. The first specified option in a command line is effective and the second one is ignored. Therefore, use `I_MPI_GTOOL` if you do not specify `-gtool` or `-gtoolfile`.

## cpuinfo

Provides information on processors used in the system.

### Syntax

```
cpuinfo [[-]<options>]
```

### Arguments

<code>&lt;options&gt;</code>	Sequence of one-letter options. Each option controls a specific part of the output data.
<code>g</code>	General information about single cluster node shows: <ul style="list-style-type: none"> <li>the processor product name</li> <li>the number of packages/sockets on the node</li> <li>core and threads numbers on the node and within each package</li> <li>SMT mode enabling</li> </ul>
<code>i</code>	Logical processors identification table identifies threads, cores, and packages of each logical processor accordingly. <ul style="list-style-type: none"> <li><i>Processor</i> - logical processor number.</li> </ul>

d	<ul style="list-style-type: none"> <li>• <i>ThreadId</i> - unique processor identifier within a core.</li> <li>• <i>CoreId</i> - unique core identifier within a package.</li> <li>• <i>PackageId</i> - unique package identifier within a node.</li> </ul> <p>Node decomposition table shows the node contents. Each entry contains the information on packages, cores, and logical processors.</p> <ul style="list-style-type: none"> <li>• <i>Package Id</i> - physical package identifier.</li> <li>• <i>Cores Id</i> - list of core identifiers that belong to this package.</li> <li>• <i>Processors Id</i> - list of processors that belong to this package. This list order directly corresponds to the core list. A group of processors enclosed in brackets belongs to one core.</li> </ul>
c	<p>Cache sharing by logical processors shows information of sizes and processors groups, which share particular cache level.</p> <ul style="list-style-type: none"> <li>• Size - cache size in bytes.</li> <li>• Processors - a list of processor groups enclosed in the parentheses those share this cache or no sharing otherwise.</li> </ul>
s	<p>Microprocessor signature hexadecimal fields (Intel platform notation) show signature values:</p> <ul style="list-style-type: none"> <li>• extended family</li> <li>• extended model</li> <li>• family</li> <li>• model</li> <li>• type</li> <li>• stepping</li> </ul>
f	<p>Microprocessor feature flags indicate what features the microprocessor supports. The Intel platform notation is used.</p>
n	<p>Table shows the following information about NUMA nodes:</p> <ul style="list-style-type: none"> <li>• NUMA Id - NUMA node identifier.</li> <li>• Processors - a list of processors in this node.</li> </ul> <p>If the node has no processors, the node is not shown.</p>
A	Equivalent to <code>gidcsf</code>
gidc	Default sequence
?	Utility usage info

## Description

The `cpuinfo` utility prints out the processor architecture information that can be used to define suitable process pinning settings. The output consists of a number of tables. Each table corresponds to one of the single options listed in the arguments table.

**NOTE**

The architecture information is available on systems based on the Intel® 64 architecture.

The `cpuinfo` utility is available for both Intel microprocessors and non-Intel microprocessors, but it may provide only partial information about non-Intel microprocessors.

An example of the `cpuinfo` output:

```
$ cpuinfo -gdcs

===== Processor composition =====
Processor name   : Intel(R) Xeon(R)  X5570
Packages(sockets) : 2
Cores           : 8
Processors(CPUs) : 8
Cores per package : 4
Threads per core : 1
===== Processor identification =====
Processor      Thread Id.    Core Id.      Package Id.
0              0             0             0
1              0             0             1
2              0             1             0
3              0             1             1
4              0             2             0
5              0             2             1
6              0             3             0
7              0             3             1

## impi\_info

Provides information on available Intel® MPI Library environment variables.

### Syntax

```
impi_info <options>
```

### Arguments

<options>	List of options.
-a   -all	Show all IMPI variables.
-h   -help	Show a help message.

-v   -variable	Show all available variables or description of the specified variable.
-c   -category	Show all available categories or variables of the specified category.

## Description

The `impi_info` utility provides information on environment variables available in the Intel MPI Library. For each variable, it prints out the name, the default value, and the value data type. By default, a reduced list of variables is displayed. Use the `-all` option to display all available variables with their descriptions.

The example of the `impi_info` output:

```
$ ./impi_info
```

NAME	DEFAULT VALUE	DATA TYPE
I_MPI_THREAD_SPLIT	0	MPI_INT
I_MPI_THREAD_RUNTIME	none	MPI_CHAR
I_MPI_THREAD_MAX	-1	MPI_INT
I_MPI_THREAD_ID_KEY	thread_id	MPI_CHAR

## mpitune

Tunes the Intel® MPI Library parameters for the given MPI application.

## Syntax

```
mpitune <options>
```

## Arguments

<mpitune options>	Options
-c   --config-file <file>	Specify a configuration file to run a tuning session.
-d   --dump-file <file>	Specify a file that stores the collected results. The option is used in the <code>analyze</code> mode.
-m   --mode {collect   analyze}	Specify the <code>mpitune</code> mode. The supported modes are <code>collect</code> and <code>analyze</code> : <ul style="list-style-type: none"> <li>the <code>collect</code> mode runs the tuning process and saves results in temporary files;</li> <li>the <code>analyze</code> mode transforms temporary files into a JSON-tree, which is used by the Intel® MPI Library, and generates a table that represents algorithm values in a human-readable format.</li> </ul>
-h   --help	Display the help message.
-v   --version	Display the product version.

## Description

The `mpitune` utility allows you to automatically adjust Intel® MPI Library parameters, such as collective operation algorithms, to your cluster configuration or application.

The tuner iteratively launches a benchmarking application with different configurations to measure performance and stores the results of each launch. Based on these results, the tuner generates optimal values for the parameters being tuned.

#### NOTE

Starting with the Intel® MPI Library Update 4 release, you must specify two mpitune configuration files, which differ in their mode and dump-file fields. A simpler alternative may be to use one of the single configuration file templates shipped with the Intel MPI Library. In this case, you must use the command line to define the mode and dump-file fields.

- The `-mode` option defines one of two possible MPI tune modes: `collect` or `analyze`.
- The `-dump-file` option defines the path to the temporary files when in analyze mode. This path is returned by mpitune after the first iteration.

The configuration files should specify all tuner parameters, which are passed to the tuner with the `--config-file` option. A typical configuration file consists of the main section, specifying generic options, and search space sections for specific library parameters (for example, for specific collective operations). To comment a line, use the hash symbol `#`. All configuration file examples are available at `<installdir>/etc/tune_cfg`. Please note that configuration files for Intel® MPI Benchmarks are already created.

The tuning process consists of two steps: data collection (the `collect` mode) and data analysis (the `analyze` mode):

```
$ mpitune -m collect -c /path/to/config_file2
$ mpitune -m analyze -c /path/to/config_file1
```

Another variant of the launch is:

```
$ mpitune -m analyze -c /path/to/config_file1
```

where the path to the dump-file received in the first step is used in the config file with templates inside.

The tuning results are presented as a JSON tree and can be added to the library with the `I_MPI_TUNING` environment variable.

### MPI Options Support

The following MPI options are available within the utility:

<MPI options>	Options
<code>-f &lt;filename&gt;</code>	Specify a file containing host names.
<code>-hosts &lt;hostlist&gt;</code>	Specify a comma-separated list of hosts.
<code>-np &lt;value&gt;</code>	Specify the number of processes.

### Examples

```
$ mpitune -np 2 -ppn 1 -hosts HOST1,HOST2 -m collect -c /path/to/config_file2
$ mpitune -np 2 -ppn 1 -hosts HOST1,HOST2 -m analyze -c /path/to/config_file1
```

### See Also

[MPI Tuning](#) in the *Developer Guide*

For available configuration options, refer to [mpitune Configuration Options](#).

---

## mpitune Configuration Options

### Application Options

#### -app

Sets a template for the command line to be launched to gather tuning results. The command line can contain variables declared as `@<var_name>@`. The variables are defined further on using other options.

For example:

```
-app: mpirun -np @np@ -ppn @ppn@ IMB-MPI1 -msglog 0:@logmax@ -npmin @np@ @func@
```

Note: The application must produce output (in `stdout` or file or any other destination) that can be parsed by the tuner to pick the value to be tuned and other variables. See the `-app-regex` and `-app-regex-legend` options below for details.

#### -app-regex

Sets a regular expression to be evaluated to extract the required values from the application output. Use regular expression groups to assign the values to variables. Variables and groups associations are set using the `-app-regex-legend` option.

For example, to extract the `#bytes` and `t_max[usec]` values from this output:

#bytes	#repetitions	t_min[usec]	t_max[usec]	t_avg[usec]
0	1000	0.06	0.06	0.06
1	1000	0.10	0.10	0.10

use the following configuration:

```
-app-regex: (\d+)\s+\d+\s+([\d.+-]+\s+([\d.+-]+))
```

#### -app-regex-legend

Specifies a list of variables extracted from the regular expression. Variables correspond to the regular expression groups. The tuner uses the last variable as the performance indicator of the launch. Use the `-tree-opt` to set the optimization direction of the indicator.

For example:

```
-app-regex-legend: size,time
```

#### -iter

Sets the number of iterations for each launch with a given set of parameters. Higher numbers of iterations increase accuracy of results.

For example:

```
-iter: 3
```

### Search Space Options

Use these options to define a search space, which is a set of combinations of Intel® MPI Library parameters that the target application uses for launches. The library parameters are generally configured using run-time options or environment variables.

Note: A search space line can be very long, so line breaking is available for all the search space options. Use a backslash to break a line (see examples below).

#### -search

Defines the search space by defining variables declared with the `-app` option and by setting environment variables for the application launch.

For example:

```
-search: func=BCAST, \
np=4,ppn={1,4},{,I_MPI_ADJUST_BCAST=[1,3]},logmax=5
```

The `-app` variables are defined as `<var1>=<value1>[,<var2>=<value2>][, ...]`. The following syntax is available for setting values:

Syntax	Description	Examples
<code>&lt;value&gt;</code>	Single value. Can be a number or a string.	4
<code>{&lt;value1&gt;[,&lt;value2&gt;][,...]}</code>	List of independent values.	{2,4}
<code>[&lt;start&gt;,&lt;end&gt;[,&lt;step&gt;]]</code>	Linear range of values with the default step of 1.	[1,8,2] — expands to {1,2,4,6,8}
<code>(&lt;start&gt;,&lt;end&gt;[,&lt;step&gt;])</code>	Exponential range with the default step of 2.	(1,16) — expands to {1,2,4,8,16}

To set environment variables for the command launch, use the following syntax:

Syntax	Description	Examples
<code>&lt;variable&gt;=&lt;value&gt;</code>	Single variable definition. Any type of the syntax above can be used for the value: single values, lists or ranges.	I_MPI_ADJUST_BCAST=3 I_MPI_ADJUST_BCAST=[1,3]
<code>{,&lt;variable&gt;=&lt;value&gt;}</code>	A special case of the syntax above. When set this way, the variable default value is first used in an application launch.	{,I_MPI_ADJUST_BCAST=[1,3]}
<code>&lt;prefix&gt;{&lt;value1&gt;[,&lt;value2&gt;][,...]}</code>	Multi-value variable definition.  Prefix is a common part for all the values, commonly the variable name.  A value can be a singular value or a combination of values in the format: <code>&lt;prefix&gt;(&lt;value1&gt;[,&lt;value2&gt;][,...])</code> . Prefix is optional and a value in the combination is a string, which can utilize the list and range syntax above.	I_MPI_ADJUST_ALLREDUCE{=1, =2,(=9,_KN_RADIX=(2,8))}  See below for a more complete example.

The following example shows a more complex option definition:

```
I_MPI_ADJUST_BCAST{=1,=2,(=9,_KN_RADIX=(2,8)),(={10,11},_SHM_KN_RADIX=[2,8,2])}
```

This directive consecutively runs the target application with the following environment variables set:

```
I_MPI_ADJUST_BCAST=1
I_MPI_ADJUST_BCAST=2
I_MPI_ADJUST_BCAST=9,I_MPI_ADJUST_BCAST_KN_RADIX=2
I_MPI_ADJUST_BCAST=9,I_MPI_ADJUST_BCAST_KN_RADIX=4
I_MPI_ADJUST_BCAST=9,I_MPI_ADJUST_BCAST_KN_RADIX=8
I_MPI_ADJUST_BCAST=10,I_MPI_ADJUST_BCAST_SHM_KN_RADIX=2
```

```
I_MPI_ADJUST_BCAST=10,I_MPI_ADJUST_BCAST_SHM_KN_RADIX=4
I_MPI_ADJUST_BCAST=10,I_MPI_ADJUST_BCAST_SHM_KN_RADIX=6
I_MPI_ADJUST_BCAST=10,I_MPI_ADJUST_BCAST_SHM_KN_RADIX=8
I_MPI_ADJUST_BCAST=11,I_MPI_ADJUST_BCAST_SHM_KN_RADIX=2
I_MPI_ADJUST_BCAST=11,I_MPI_ADJUST_BCAST_SHM_KN_RADIX=4
I_MPI_ADJUST_BCAST=11,I_MPI_ADJUST_BCAST_SHM_KN_RADIX=6
I_MPI_ADJUST_BCAST=11,I_MPI_ADJUST_BCAST_SHM_KN_RADIX=8
```

### -search-excl

Excludes certain combinations from the search space. The syntax is identical to that of the `-search` option. For example:

```
-search-excl: I_MPI_ADJUST_BCAST={1,2}
```

or

```
-search-excl: func=BCAST,np=4,ppn=1,I_MPI_ADJUST_BCAST=1
```

### -search-only

Defines a subset of the search space to search in. Only this subset is used for application launches. The syntax is identical to the `-search` option.

This option is useful for the second and subsequent tuning sessions on a subset of parameters from the original session, without creating a separate configuration file.

## Output Options

Use these options to customize the output. The tuner can produce output of two types:

- `table`— useful for verifying the tuning results, contains values from all the application launches
- `tree`— an internal output format, contains the optimal values

### -table

Defines the layout for the resulting output table. The option value is a list of variables declared with the `-app` option, which are joined in colon-separated groups. Each group denotes a specific part of the table.

For example:

```
-table: func:ppn,np:size:*:time
```

The last group variables (`time`) are rendered in table cells. The second last group variables are used for building table columns (`*`, denotes all the variables not present the other variable groups). The third last group variables are used for building table rows (`size`). All other variable groups are used to make up the table label. Groups containing several variables are complex groups and produce output based on all the value combinations.

For example, the option definition above can produce the following output:

```
Label: "func=BCAST,ppn=2,np=2"
```

```
Legend:
```

```
set 0: ""
```

```
set 1: "I_MPI_ADJUST_BCAST=1"
```

```
set 2: "I_MPI_ADJUST_BCAST=2"
```

```
set 3: "I_MPI_ADJUST_BCAST=3"
```

```
Table:
```

```

      | set 0      | set 1      | set 2      | set 3
-----|-----|-----|-----|-----
```

```

"size=0" | "time=0.10" | "time=0.08" | "time=0.11" | "time=0.10"
          | "time=0.12" | "time=0.09" | "time=0.12" | "time=0.11"
          | "time=0.10" |
-----|-----|-----|-----|-----
"size=4" | "time=1.12" | "time=1.11" | "time=1.94" | "time=1.72"
          | "time=1.35" | "time=1.18" | "time=1.97" | "time=1.81"
          | "time=1.38" | "time=1.23" | "time=2.11" | "time=1.89"
-----|-----|-----|-----|-----
"size=8" | "time=1.21" | "time=1.10" | "time=1.92" | "time=1.72"
          | "time=1.36" | "time=1.16" | "time=2.01" | "time=1.75"
          | "time=1.37" | "time=1.17" | "time=2.24" | "time=1.87"
-----|-----|-----|-----|-----
...

```

Cells include only unique values from all the launches for the given parameter combination. The number of launches is set with the `-iter` option.

`-table-ignore`

Specifies the variables to ignore from the `-table` option definition.

`-tree`

Defines the layout for the resulting tree of optimal values of the parameter that is tuned (for example, collective operation algorithms). The tree is rendered as a JSON structure. The option value is a list of variables declared with the `-app` option, which are joined in colon-separated groups. Each group denotes a specific part of the tree. Groups containing several variables are complex groups and produce output based on all the value combinations.

Example:

```
-tree: func:ppn,np:size:*:time
```

The first two groups (`func` and `ppn,np`) make up the first two levels of the tree. The last group variables (`time`) are used as the optimization criteria and are not rendered. The second last group contains variables to be optimized (`*`, denotes all the variables not present the other variable groups). The third last group variables are used to split the search space into intervals based on the optimal values of parameters from the next group (for example, `I_MPI_ADJUST_<operation>` algorithm numbers).

For example, the option definition above can produce the following output:

```

{
  "func=BCAST":
  {
    "ppn=1,np=4":
    {
      "size=0":
        {"I_MPI_ADJUST_BCAST": "3"},
      "size=64":
        {"I_MPI_ADJUST_BCAST": "1"},
      "size=512":
        {"I_MPI_ADJUST_BCAST": "2"},
      ...
    }
  }
}

```

This tree representation is an intermediate format of tuning results and is ultimately converted to a string that the library can understand. The conversion script is specified with `-tree-postprocess` option.

`-tree-ignore`

---

Specifies the variables to ignore from the `-tree` option definition.

`-tree-intervals`

Specifies the maximum number of intervals where the optimal parameter value is applied. If not specified, any number of intervals is allowed.

`-tree-tolerance`

Specifies the tolerance level. Non-zero tolerance (for example, 0.03 for 3%) joins resulting intervals with the performance indicator value varying by the specified tolerance.

`-tree-postprocess`

Specifies an executable to convert the resulting JSON tree to a custom format.

`-tree-opt`

Specifies the optimization direction. The available values are `max` (default) and `min`.

`-tree-file`

Specifies a log file where the tuning results are saved.

`-tree-view`

Specify the mode to present the json-tree. The available values are "simple" and "default". The "default" mode enables an interpolation mechanism; the "simple" mode disables the interpolation mechanism. The resulting tree contains message sizes used during the launch.

`-mode`

Specifies the mpitune mode. The available values are "collect" for gathering data and "analyze" for converting this data to a JSON-tree. Note that the `-mode` field can be defined in the configuration file as macros `@-mode@`, although the real value must be defined in the command line.

`-dump-file`

Specifies the path for the dump-file, which is returned by mpitune after the first iteration. The first iteration can be initialized by way of "" (an empty string). Note that the `-dump-file` field can be defined in the configuration file as macros `@-dump-file@`, although the real value must be defined in the command line.

## mpitune\_fast

---

This utility tunes the Intel® MPI Library to the cluster configuration using the [Autotuning](#) functionality.

### Syntax

`mpitune_fast <options>`

### Arguments

<code>&lt;mpitune options&gt;</code>	Options
<code>-c   --colls</code>	Set custom collective operations to tune delimited by commas.
<code>-d   --results_dir</code>	Set custom directory for tuning results, host files and logs.  Default: current working directory.
<code>-h   --help</code>	Display the help message.
<code>-n &lt;n&gt;</code>	Specify the number of nodes. This can be a comma-delimited set of values to set up several launches.

<b>&lt;mpitune options&gt;</b>	<b>Options</b>
<code>-ppn &lt;n&gt;</code>	Specify the number of processes per node. This can be a comma-delimited set of values to set up several launches.

## Description

The `mpitune_fast` utility allows you to automatically set up the Intel® MPI Library and launch with Autotuning enabled and configured for your cluster configuration.

The tool iteratively launches the [Intel® MPI Benchmarks](#) utility with the proper autotuner environment and generates a `.dat` file with the tuning parameters for your cluster configuration.

After generation the tuning file, set it as `I_MPI_TUNING_BIN`:

```
$ export I_MPI_TUNING_BIN=./tuning_results.dat
$ mpiexec <args>
```

## Workload Managers Support

`mpitune_fast` supports Slurm and LSF workload managers. It automatically defines job allocated hosts and performs launches.

## MPI Options Support

The following MPI options are available within the utility:

<b>&lt;MPI options&gt;</b>	<b>Options</b>
<code>-f &lt;filename&gt;</code>	Specify a file containing host names.

Example (default launch):

```
$ mpitune_fast -f ./hostfile
```

Example (customized launch):

```
$ mpitune_fast -ppn 8,4,2,1 -f ./hostfile -c alltoall,allreduce,barrier
```

# Environment Variable Reference

---

This section provides information on different variables:

- [Compilation Environment Variables](#)
- [Hydra Environment Variables](#)
- [I\\_MPI\\_ADJUST Family Environment Variables](#)
- [Process Pinning](#)
- [Environment Variables for Fabrics Control](#)
- [Environment Variables for Asynchronous Progress Control](#)
- [Environment Variables for Multi-EP](#)
- [Other Environment Variables](#)

## Compilation Environment Variables

---

### **I\_MPI\_{CC,CXX,FC,F77,F90}\_PROFILE**

Specify the default profiling library.

#### **Syntax**

```
I_MPI_CC_PROFILE=<profile_name>
I_MPI_CXX_PROFILE=<profile_name>
I_MPI_FC_PROFILE=<profile_name>
I_MPI_F77_PROFILE=<profile_name>
I_MPI_F90_PROFILE=<profile_name>
```

#### **Argument**

<profile_name>	Specify a default profiling library.
----------------	--------------------------------------

#### **Description**

Set this environment variable to select a specific MPI profiling library to be used by default. This has the same effect as using `-profile=<profile_name>` as an argument for `mpiicc` or another Intel® MPI Library compiler wrapper.

### **I\_MPI\_TRACE\_PROFILE**

Specify the default profile for the `-trace` option.

#### **Syntax**

```
I_MPI_TRACE_PROFILE=<profile_name>
```

#### **Argument**

<profile_name>	Specify a tracing profile name. The default value is <code>vt</code> .
----------------	--

#### **Description**

Set this environment variable to select a specific MPI profiling library to be used with the `-trace` option of `mpiicc` or another Intel® MPI Library compiler wrapper.

The `I_MPI_{CC,CXX,F77,F90}_PROFILE` environment variable overrides `I_MPI_TRACE_PROFILE`.

## **I\_MPI\_CHECK\_PROFILE**

Specify the default profile for the `-check_mpi` option.

### **Syntax**

`I_MPI_CHECK_PROFILE=<profile_name>`

### **Argument**

<code>&lt;profile_name&gt;</code>	Specify the checking profile name. The default value is <code>vtmc</code> .
-----------------------------------	---

### **Description**

Set this environment variable to select a specific MPI checking library to be used with the `-check_mpi` option to `mpiicc` or another Intel® MPI Library compiler wrapper.

The `I_MPI_{CC,CXX,F77,F90}_PROFILE` environment variable overrides `I_MPI_CHECK_PROFILE`.

## **I\_MPI\_CHECK\_COMPILER**

Turn on/off compiler compatibility check.

### **Syntax**

`I_MPI_CHECK_COMPILER=<arg>`

### **Arguments**

<code>&lt;arg&gt;</code>	Binary indicator.
<code>enable   yes   on   1</code>	Enable checking the compiler.
<code>disable   no   off   0</code>	Disable checking the compiler. This is the default value.

### **Description**

If `I_MPI_CHECK_COMPILER` is set to `enable`, the Intel MPI Library compiler wrapper checks the underlying compiler for compatibility. Normal compilation requires using a known version of the underlying compiler.

## **I\_MPI\_{CC,CXX,FC,F77,F90}**

Set the path/name of the underlying compiler to be used.

### **Syntax**

`I_MPI_CC=<compiler>`

`I_MPI_CXX=<compiler>`

`I_MPI_FC=<compiler>`

`I_MPI_F77=<compiler>`

`I_MPI_F90=<compiler>`

---

## Arguments

<code>&lt;compiler&gt;</code>
-------------------------------

Specify the full path/name of compiler to be used.
--

## Description

Set this environment variable to select a specific compiler to be used. Specify the full path to the compiler if it is not located in the search path.

---

### NOTE

Some compilers may require additional command line options.

---

---

### NOTE

The configuration file is sourced if it exists for a specified compiler. See [-config](#) for details.

---

## I\_MPI\_ROOT

Set the Intel® MPI Library installation directory path.

## Syntax

`I_MPI_ROOT=<path>`

## Arguments

<code>&lt;path&gt;</code>
---------------------------

Specify the installation directory of the Intel® MPI Library.
---

## Description

Set this environment variable to specify the installation directory of the Intel® MPI Library.

## VT\_ROOT

Set Intel® Trace Collector installation directory path.

## Syntax

`VT_ROOT=<path>`

## Arguments

<code>&lt;path&gt;</code>
---------------------------

Specify the installation directory of the Intel® Trace Collector
--

## Description

Set this environment variable to specify the installation directory of the Intel® Trace Collector.

## I\_MPI\_COMPILER\_CONFIG\_DIR

Set the location of the compiler configuration files.

## Syntax

`I_MPI_COMPILER_CONFIG_DIR=<path>`

## Arguments

<code>&lt;path&gt;</code>	Specify the location of the compiler configuration files. The default value is <code>&lt;installdir&gt;/etc</code>
---------------------------	---

## Description

Set this environment variable to change the default location of the compiler configuration files.

## I\_MPI\_LINK

Select a specific version of the Intel® MPI Library for linking.

## Syntax

`I_MPI_LINK=<arg>`

## Arguments

<code>&lt;arg&gt;</code>	Version of library
<code>opt</code>	Multi-threaded optimized library (with the global lock). This is the default value
<code>dbg</code>	Multi-threaded debug library (with the global lock)
<code>opt_mt</code>	Multi-threaded optimized library (with per-object lock for the thread-split model)
<code>dbg_mt</code>	Multi-threaded debug library (with per-object lock for the thread-split model)

## Description

Set this variable to always link against the specified version of the Intel® MPI Library.

## I\_MPI\_DEBUG\_INFO\_STRIP

Turn on/off the debug information stripping while linking applications statically.

## Syntax

`I_MPI_DEBUG_INFO_STRIP=<arg>`

## Arguments

<code>&lt;arg&gt;</code>	Binary indicator
<code>enable   yes   on   1</code>	Turn on. This is the default value
<code>disable   no   off   0</code>	Turn off

## Description

Use this option to turn on/off the debug information stripping while linking the Intel® MPI Library statically. Debug information is stripped by default.

## I\_MPI\_{C,CXX,FC,F}FLAGS

Set special flags needed for compilation.

## Syntax

`I_MPI_CFLAGS=<flags>`

---

```
I_MPI_CXXFLAGS=<flags>
```

```
I_MPI_FCFLAGS=<flags>
```

```
I_MPI_FFLAGS=<flags>
```

## Arguments

<flags>	Flag list
---------	-----------

## Description

Use this environment variable to specify special compilation flags.

## I\_MPI\_LDFLAGS

Set special flags needed for linking.

## Syntax

```
I_MPI_LDFLAGS=<flags>
```

## Arguments

<flags>	Flag list
---------	-----------

## Description

Use this environment variable to specify special linking flags.

## I\_MPI\_FORT\_BIND

Disable `mpicc` linking with Fortran bindings.

## Syntax

```
I_MPI_FORT_BIND=<arg>
```

## Arguments

<arg>	Binary indicator
enable   yes   on   1	Enable linking. This is the default value
disable   no   off   0	Disable linking

## Description

By default, the `mpicc` also links against the Fortran bindings even if Fortran is not used. Use this environment variable to change this default behavior. Has the same effect as the `-nofortbind` option.

# Hydra Environment Variables

---

## I\_MPI\_HYDRA\_HOST\_FILE

Set the host file to run the application.

## Syntax

```
I_MPI_HYDRA_HOST_FILE=<arg>
```

## Arguments

<code>&lt;arg&gt;</code>	String parameter
<code>&lt;hostsfile&gt;</code>	The full or relative path to the host file

## Description

Set this environment variable to specify the hosts file.

## I\_MPI\_HYDRA\_HOSTS\_GROUP

Set node ranges using brackets, commas, and dashes.

## Syntax

```
I_MPI_HYDRA_HOSTS_GROUP=<arg>
```

## Argument

<code>&lt;arg&gt;</code>	Set a node range.
--------------------------	-------------------

## Description

Set this variable to be able to set node ranges using brackets, commas, and dashes (like in Slurm\* Workload Manager). For example:

```
I_MPI_HYDRA_HOSTS_GROUP="hostA[01-05],hostB,hostC[01-05,07,09-11]"
```

You can set node ranges with the `-hosts-group` option.

## I\_MPI\_HYDRA\_DEBUG

Print out the debug information.

## Syntax

```
I_MPI_HYDRA_DEBUG=<arg>
```

## Arguments

<code>&lt;arg&gt;</code>	Binary indicator
<code>enable   yes   on   1</code>	Turn on the debug output
<code>disable   no   off   0</code>	Turn off the debug output. This is the default value

## Description

Set this environment variable to enable the debug mode.

## I\_MPI\_HYDRA\_ENV

Control the environment propagation.

## Syntax

```
I_MPI_HYDRA_ENV=<arg>
```

---

## Arguments

<code>&lt;arg&gt;</code>	String parameter
<code>all</code>	Pass all environment to all MPI processes

## Description

Set this environment variable to control the environment propagation to the MPI processes. By default, the entire launching node environment is passed to the MPI processes. Setting this variable also overwrites environment variables set by the remote shell.

## I\_MPI\_JOB\_TIMEOUT

Set the timeout period for `mpiexec.hydra`.

## Syntax

`I_MPI_JOB_TIMEOUT=<timeout>`

`I_MPI_MPIEXEC_TIMEOUT=<timeout>`

## Arguments

<code>&lt;timeout&gt;</code>	Define <code>mpiexec.hydra</code> timeout period in seconds
<code>&lt;n&gt; ≥ 0</code>	The value of the timeout period. The default timeout value is zero, which means no timeout.

## Description

Set this environment variable to make `mpiexec.hydra` terminate the job in `<timeout>` seconds after its launch. The `<timeout>` value should be greater than zero. Otherwise the environment variable setting is ignored.

## I\_MPI\_JOB\_STARTUP\_TIMEOUT

Set the `mpiexec.hydra` job startup timeout.

## Syntax

`I_MPI_JOB_STARTUP_TIMEOUT=<timeout>`

## Arguments

<code>&lt;timeout&gt;</code>	Define <code>mpiexec.hydra</code> startup timeout period in seconds
<code>&lt;n&gt; ≥ 0</code>	The value of the timeout period. The default timeout value is zero, which means no timeout.

## Description

Set this environment variable to make `mpiexec.hydra` terminate the job in `<timeout>` seconds if some processes are not launched. The `<timeout>` value should be greater than zero.

## I\_MPI\_JOB\_TIMEOUT\_SIGNAL

Define the signal to be sent when a job is terminated because of a timeout.

## Syntax

`I_MPI_JOB_TIMEOUT_SIGNAL=<number>`

## Arguments

<code>&lt;number&gt;</code>	Define the signal number
<code>&lt;n&gt;&gt; 0</code>	The signal number. The default value is 9 (SIGKILL)

## Description

Define a signal number to be sent to stop the MPI job if the timeout period specified by the `I_MPI_JOB_TIMEOUT` environment variable expires. If you set a signal number unsupported by the system, the `mpiexec.hydra` command prints a warning message and continues the task termination using the default signal number 9 (SIGKILL).

## I\_MPI\_JOB\_ABORT\_SIGNAL

Define a signal to be sent to all processes when a job is terminated unexpectedly.

## Syntax

`I_MPI_JOB_ABORT_SIGNAL=<number>`

## Arguments

<code>&lt;number&gt;</code>	Define signal number
<code>&lt;n&gt;&gt; 0</code>	The default value is 9 (SIGKILL)

## Description

Set this environment variable to define a signal for task termination. If you set an unsupported signal number, `mpiexec.hydra` prints a warning message and uses the default signal 9 (SIGKILL).

## I\_MPI\_JOB\_SIGNAL\_PROPAGATION

Control signal propagation.

## Syntax

`I_MPI_JOB_SIGNAL_PROPAGATION=<arg>`

## Arguments

<code>&lt;arg&gt;</code>	Binary indicator
<code>enable   yes   on   1</code>	Turn on propagation
<code>disable   no   off   0</code>	Turn off propagation. This is the default value

## Description

Set this environment variable to control propagation of the signals (SIGINT, SIGALRM, and SIGTERM). If you enable signal propagation, the received signal is sent to all processes of the MPI job. If you disable signal propagation, all processes of the MPI job are stopped with the default signal 9 (SIGKILL).

## I\_MPI\_HYDRA\_BOOTSTRAP

Set the bootstrap server.

---

## Syntax

`I_MPI_HYDRA_BOOTSTRAP=<arg>`

## Arguments

<code>&lt;arg&gt;</code>	String parameter
<code>ssh</code>	Use secure shell. This is the default value
<code>rsh</code>	Use remote shell
<code>pdsh</code>	Use parallel distributed shell
<code>pbsdsh</code>	Use Torque* and PBS* <code>pbsdsh</code> command
<code>fork</code>	Use fork call
<code>slurm</code>	Use Slurm* <code>srun</code> command
<code>ll</code>	Use LoadLeveler* <code>llspawn.stdio</code> command
<code>lsf</code>	Use LSF* <code>blaunch</code> command
<code>sgc</code>	Use Univa* Grid Engine* <code>qrsh</code> command
<code>jmi</code>	Use Job Manager Interface (tighter integration)

## Description

Set this environment variable to specify the bootstrap server.

---

### NOTE

---

## I\_MPI\_HYDRA\_BOOTSTRAP\_EXEC

Set the executable file to be used as a bootstrap server.

## Syntax

`I_MPI_HYDRA_BOOTSTRAP_EXEC=<arg>`

## Arguments

<code>&lt;arg&gt;</code>	String parameter
<code>&lt;executable&gt;</code>	The name of the executable file

## Description

Set this environment variable to specify the executable file to be used as a bootstrap server.

## I\_MPI\_HYDRA\_BOOTSTRAP\_EXEC\_EXTRA\_ARGS

Set additional arguments for the bootstrap server.

## Syntax

`I_MPI_HYDRA_BOOTSTRAP_EXEC_EXTRA_ARGS=<arg>`

## Arguments

<code>&lt;arg&gt;</code>	String parameter
--------------------------	------------------

&lt;args&gt;

Additional bootstrap server arguments

## Description

Set this environment variable to specify additional arguments for the bootstrap server.

### NOTE

If the launcher (blaunch, lsf, pdsh, pbsdsh) falls back to ssh, pass the arguments with the invocation of ssh.

## I\_MPI\_HYDRA\_BOOTSTRAP\_AUTOFORK

Control the usage of `fork` call for local processes.

## Syntax

`I_MPI_HYDRA_BOOTSTRAP_AUTOFORK = <arg>`

## Arguments

&lt;arg&gt;

enable | yes | on | 1

disable | no | off | 0

String parameter

Use `fork` for the local processes. This is default value for ssh, rsh, ll, lsfl, and pbsdsh bootstrap servers

Do not use `fork` for the local processes. This is default value for the sge bootstrap server

## Description

Set this environment variable to control usage of `fork` call for the local processes.

### NOTE

This option is not applicable to `slurm` and `pdsh` bootstrap servers.

## I\_MPI\_HYDRA\_RMK

Use the specified value as the resource management kernel to obtain data about available nodes, externally set process counts.

## Syntax

`I_MPI_HYDRA_RMK=<arg>`

## Arguments

&lt;arg&gt;

&lt;rmk&gt;

String parameter

Resource management kernel. The supported values are `slurm`, `ll`, `lsf`, `sge`, `pbs`, `cobalt`.

## Description

Set this environment variable to use the resource management kernel.

---

## I\_MPI\_HYDRA\_PMI\_CONNECT

Define the processing method for PMI messages.

### Syntax

I\_MPI\_HYDRA\_PMI\_CONNECT=<value>

### Arguments

<value>	The algorithm to be used
nocache	Do not cache PMI messages
cache	Cache PMI messages on the local pmi_proxy management processes to minimize the number of PMI requests. Cached information is automatically propagated to child management processes.
lazy-cache	cache mode with on-demand propagation.
alltoall	Information is automatically exchanged between all pmi_proxy before any get request can be done. This is the default value.

### Description

Use this environment variable to select the PMI messages processing method.

## I\_MPI\_PERHOST

Define the default behavior for the `-perhost` option of the `mpiexec.hydra` command.

### Syntax

I\_MPI\_PERHOST=<value>

### Arguments

<value>	Define a value used for <code>-perhost</code> by default
integer > 0	Exact value for the option
all	All logical CPUs on the node
allcores	All cores (physical CPUs) on the node. This is the default value.

### Description

Set this environment variable to define the default behavior for the `-perhost` option. Unless specified explicitly, the `-perhost` option is implied with the value set in `I_MPI_PERHOST`.

---

#### NOTE

When running under a job scheduler, this environment variable is ignored by default. To control process placement with `I_MPI_PERHOST`, disable the `I_MPI_JOB_RESPECT_PROCESS_PLACEMENT` variable.

---

## I\_MPI\_JOB\_TRACE\_LIBS

Choose the libraries to preload through the `-trace` option.

## Syntax

`I_MPI_JOB_TRACE_LIBS=<arg>`

## Arguments

<code>&lt;arg&gt;</code>	String parameter
<code>&lt;list&gt;</code>	Blank separated list of the libraries to preload. The default value is <code>vt</code>

## Description

Set this environment variable to choose an alternative library for preloading through the `-trace` option.

## I\_MPI\_JOB\_CHECK\_LIBS

Choose the libraries to preload through the `-check_mpi` option.

## Syntax

`I_MPI_JOB_CHECK_LIBS=<arg>`

## Arguments

<code>&lt;arg&gt;</code>	String parameter
<code>&lt;list&gt;</code>	Blank separated list of the libraries to preload. The default value is <code>vtmc</code>

## Description

Set this environment variable to choose an alternative library for preloading through the `-check_mpi` option.

## I\_MPI\_HYDRA\_BRANCH\_COUNT

Set the hierarchical branch count.

## Syntax

`I_MPI_HYDRA_BRANCH_COUNT = <num>`

## Arguments

<code>&lt;num&gt;</code>	Number
<code>&lt;n&gt; &gt;= 0</code>	<p>The default value is 16. This value means that hierarchical structure is enabled if the number of nodes is more than 16.</p> <p>If <code>I_MPI_HYDRA_BRANCH_COUNT=0</code>, then there is no hierarchical structure.</p> <p>If <code>I_MPI_HYDRA_BRANCH_COUNT=-1</code>, then branch count is equal to default value.</p>

## Description

Set this environment variable to restrict the number of child management processes launched by the `mpirexec.hydra` operation or by each `pmi_proxy` management process.

---

## I\_MPI\_HYDRA\_PMI\_AGGREGATE

Turn on/off aggregation of the PMI messages.

### Syntax

`I_MPI_HYDRA_PMI_AGGREGATE=<arg>`

### Arguments

<code>&lt;arg&gt;</code>	Binary indicator
<code>enable   yes   on   1</code>	Enable PMI message aggregation. This is the default value.
<code>disable   no   off   0</code>	Disable PMI message aggregation.

### Description

Set this environment variable to enable/disable aggregation of PMI messages.

## I\_MPI\_HYDRA\_GDB\_REMOTE\_SHELL

Set the remote shell command to run the GDB debugger. In Intel Parallel Studio Extended Edition, this command uses a GDB debugger specific to Intel® architecture. In Intel® oneAPI, this command uses the Intel® Distribution for GDB.

### Syntax

`I_MPI_HYDRA_GDB_REMOTE_SHELL=<arg>`

### Arguments

<code>&lt;arg&gt;</code>	String parameter
<code>ssh</code>	Secure Shell (SSH). This is the default value
<code>rsh</code>	Remote shell (RSH)

### Description

Set this environment variable to specify the remote shell command to run the GNU\* debugger on the remote machines. You can use this environment variable to specify any shell command that has the same syntax as SSH or RSH.

## I\_MPI\_HYDRA\_IFACE

Set the network interface.

### Syntax

`I_MPI_HYDRA_IFACE=<arg>`

### Arguments

<code>&lt;arg&gt;</code>	String parameter
<code>&lt;network interface&gt;</code>	The network interface configured in your system

### Description

Set this environment variable to specify the network interface to use. For example, use `"-iface ib0"`, if the IP emulation of your InfiniBand\* network is configured on `ib0`.

## I\_MPI\_HYDRA\_DEMUX

Set the demultiplexer (demux) mode.

### Syntax

I\_MPI\_HYDRA\_DEMUX=<arg>

### Arguments

<arg>	String parameter
poll	Set <code>poll</code> as the multiple I/O demultiplexer (demux) mode engine. This is the default value.
select	Set <code>select</code> as the multiple I/O demultiplexer (demux) mode engine

### Description

Set this environment variable to specify the multiple I/O demux mode engine. The default value is `poll`.

## I\_MPI\_TMPDIR

Specify a temporary directory.

### Syntax

I\_MPI\_TMPDIR=<arg>

### Arguments

<arg>	String parameter
<path>	Temporary directory. The default value is <code>/tmp</code>

### Description

Set this environment variable to specify a directory for temporary files.

## I\_MPI\_JOB\_RESPECT\_PROCESS\_PLACEMENT

Specify whether to use the process-per-node placement provided by the job scheduler, or set explicitly.

### Syntax

I\_MPI\_JOB\_RESPECT\_PROCESS\_PLACEMENT=<arg>

### Arguments

<value>	Binary indicator
enable   yes   on   1	Use the process placement provided by job scheduler. This is the default value
disable   no   off   0	Do not use the process placement provided by job scheduler

### Description

If the variable is set, the Hydra process manager uses the process placement provided by job scheduler (default). In this case the `-ppn` option and its equivalents are ignored. If you disable the variable, the Hydra process manager uses the process placement set with `-ppn` or its equivalents.

## I\_MPI\_GTOOL

Specify the tools to be launched for selected ranks. An alternative to this variable is the `-gtool` option.

### Syntax

```
I_MPI_GTOOL="<command line for a tool 1>:<ranks set 1>[=exclusive][@arch 1]; <command line for a tool 2>:<ranks set 2>[=exclusive][@arch 2]; ... ;<command line for a tool n>:<ranks set n>[=exclusive][@arch n]"
```

### Arguments

<code>&lt;arg&gt;</code>	Parameters
<code>&lt;command line for a tool&gt;</code>	Specify a tool's launch command, including parameters.
<code>&lt;rank set&gt;</code>	Specify the range of ranks that are involved in the tool execution. Separate ranks with a comma or use the '-' symbol for a set of contiguous ranks. To run the tool for all ranks, use the <code>all</code> argument.
<hr/>	
<b>NOTE</b>	
If you specify incorrect rank index, the corresponding warning is printed and the tool continues working for valid ranks.	
<hr/>	
<code>[=exclusive]</code>	Specify this parameter to prevent launching a tool for more than one rank per host. This parameter is optional.
<code>@arch</code>	Specify the architecture on which the tool runs (optional). For a given <code>&lt;rank set&gt;</code> , if you specify this argument, the tool is launched only for the processes residing on hosts with the specified architecture. This parameter is optional.

### Description

Use this option to launch the tools such as Intel® VTune™ Amplifier XE, Valgrind\*, and GNU\* Debugger for the specified processes.

### Examples

The following command line examples demonstrate different scenarios of using the `I_MPI_GTOOL` environment variable.

Launch Intel® VTune™ Amplifier XE and Valgrind\* by setting the `I_MPI_GTOOL` environment variable:

```
$ export I_MPI_GTOOL="amplxe-cl -collect hotspots -analyze-system -r  
result1:5,3,7-9=exclusive@bdw;\  
valgrind -log-file=log_%p:0,1,10-12@hsw"  
$ mpiexec.hydra -n 16 a.out
```

This command launches `amplxe-cl` for the processes that are run on the Intel® microarchitecture codenamed Broadwell. Only one copy of `amplxe-cl` is launched for each host, the process with the minimal index is affected. At the same time, Valgrind\* is launched for all specified processes that are run on the Intel® microarchitecture codenamed Haswell. Valgrind's results are saved to the files `log_<process ID>`.

Launch GDB by setting the `I_MPI_GTOOL` environment variable (for Intel® oneAPI, this launches the Intel® Distribution for GDB):

```
$ mpiexec.hydra -n 16 -genv I_MPI_GTOOL="gdb:3,5,7-9" a.out
```

Use this command to apply GDB to the given rank set.

#### NOTE

The options and the environment variable `-gtool`, `-gtoolfile` and `I_MPI_GTOOL` are mutually exclusive. The options `-gtool` and `-gtoolfile` are of the same priority and have higher priority than `I_MPI_GTOOL`. The first specified option in a command line is effective and the second one is ignored. Therefore, use `I_MPI_GTOOL` if you do not specify `-gtool` or `-gtoolfile`.

## I\_MPI\_HYDRA\_TOPOLIB

Set the interface for topology detection.

### Syntax

`I_MPI_HYDRA_TOPOLIB=<arg>`

### Arguments

<code>&lt;arg&gt;</code>	String parameter
<code>hwloc</code>	The <code>hwloc*</code> library functions are invoked for topology detection.

### Description

Set this environment variable to define the interface for platform detection. The `hwloc*` interface is used by default, but you may explicitly set the variable to use the native Intel MPI Library interface:

`I_MPI_HYDRA_TOPOLIB=ipl.`

## I\_MPI\_PORT\_RANGE

Specify a range of allowed port numbers.

### Syntax

`I_MPI_PORT_RANGE=<range>`

### Arguments

<code>&lt;range&gt;</code>	String parameter
<code>&lt;min&gt;:&lt;max&gt;</code>	Allowed port range

### Description

Set this environment variable to specify a range of the allowed port numbers for the Intel® MPI Library.

## I\_MPI\_SILENT\_ABORT

Control abort warning messages.

### Syntax

`I_MPI_SILENT_ABORT=<arg>`

---

## Argument

<code>&lt;arg&gt;</code>	Binary indicator
<code>enable   yes   on   1</code>	Do not print abort warning message
<code>disable   no   off   0</code>	Print abort warning message. This is the default value

## Description

Set this variable to disable printing of abort warning messages. The messages are printed in case of the `MPI_Abort` call.

You can also disable printing of these messages with the `-silent-abort` option.

## I\_MPI\_HYDRA\_NAMESERVER

Specify the nameserver.

## Syntax

`I_MPI_HYDRA_NAMESERVER=<arg>`

## Argument

<code>&lt;arg&gt;</code>	String parameter
<code>&lt;hostname&gt;:&lt;port&gt;</code>	Set the hostname and the port.

## Description

Set this variable to specify the nameserver for your MPI application in the following format:

```
I_MPI_HYDRA_NAMESERVER = hostname:port
```

You can set the nameserver with the `-nameserver` option.

---

# I\_MPI\_ADJUST Family Environment Variables

## I\_MPI\_ADJUST\_<opname>

Control collective operation algorithm selection.

## Syntax

`I_MPI_ADJUST_<opname>="<algid>[:<conditions>][;<algid>:<conditions>[...]]"`

## Arguments

<code>&lt;algid&gt;</code>	Algorithm identifier
<code>&gt;= 0</code>	The default value of zero selects the reasonable settings
<code>&lt;conditions&gt;</code>	A comma separated list of conditions. An empty list selects all message sizes and process combinations
<code>&lt;l&gt;</code>	Messages of size <code>&lt;l&gt;</code>
<code>&lt;l&gt;-&lt;m&gt;</code>	Messages of size from <code>&lt;l&gt;</code> to <code>&lt;m&gt;</code> , inclusive
<code>&lt;l&gt;@&lt;p&gt;</code>	Messages of size <code>&lt;l&gt;</code> and number of processes <code>&lt;p&gt;</code>
<code>&lt;l&gt;-&lt;m&gt;@&lt;p&gt;-&lt;q&gt;</code>	Messages of size from <code>&lt;l&gt;</code> to <code>&lt;m&gt;</code> and number of processes from <code>&lt;p&gt;</code> to <code>&lt;q&gt;</code> , inclusive

## Description

Set this environment variable to select the desired algorithm(s) for the collective operation *<opname>* under particular conditions. Each collective operation has its own environment variable and algorithms.

### Environment Variables, Collective Operations, and Algorithms

Environment Variable	Collective Operation	Algorithms
I_MPI_ADJUST_ALLGATHER	MPI_Allgather	<ol style="list-style-type: none"> <li>1. Recursive doubling</li> <li>2. Bruck's</li> <li>3. Ring</li> <li>4. Topology aware Gather + Bcast</li> <li>5. Knomial</li> </ol>

I_MPI_ADJUST_ISCAN	MPI_Iscan	<ol style="list-style-type: none"> <li>1. Recursive Doubling</li> <li>2. SMP</li> </ol>
I_MPI_ADJUST_ISCATTER	MPI_Iscatter	<ol style="list-style-type: none"> <li>1. Binomial</li> <li>2. Knomial</li> </ol>
I_MPI_ADJUST_ISCATTERV	MPI_Iscatterv	Linear

The message size calculation rules for the collective operations are described in the table. In the following table, "n/a" means that the corresponding interval  $\langle l \rangle - \langle m \rangle$  should be omitted.

**NOTE** The I\_MPI\_ADJUST\_SENDRECV\_REPLACE=2 ("Uniform") algorithm can be used only in the case when datatype and objects count are the same across all ranks.

### Message Collective Functions

Collective Function	Message Size Formula
MPI_Allgather	$\text{recv\_count} * \text{recv\_type\_size}$
MPI_Allgatherv	$\text{total\_recv\_count} * \text{recv\_type\_size}$
MPI_Allreduce	$\text{count} * \text{type\_size}$
MPI_Alltoall	$\text{send\_count} * \text{send\_type\_size}$
MPI_Alltoallv	n/a
MPI_Alltoallw	n/a
MPI_Barrier	n/a
MPI_Bcast	$\text{count} * \text{type\_size}$
MPI_Exscan	$\text{count} * \text{type\_size}$

Collective Function	Message Size Formula
MPI_Gather	recv_count*recv_type_size if MPI_IN_PLACE is used, otherwise send_count*send_type_size
MPI_Gatherv	n/a
MPI_Reduce_scatter	total_recv_count*type_size
MPI_Reduce	count*type_size
MPI_Scan	count*type_size
MPI_Scatter	send_count*send_type_size if MPI_IN_PLACE is used, otherwise recv_count*recv_type_size
MPI_Scatterv	n/a

## Examples

Use the following settings to select the second algorithm for MPI\_Reduce operation:

```
I_MPI_ADJUST_REDUCE=2
```

Use the following settings to define the algorithms for MPI\_Reduce\_scatter operation:

```
I_MPI_ADJUST_REDUCE_SCATTER="4:0-100,5001-10000;1:101-3200;2:3201-5000;3"
```

In this case, algorithm 4 is used for the message sizes between 0 and 100 bytes and from 5001 and 10000 bytes, algorithm 1 is used for the message sizes between 101 and 3200 bytes, algorithm 2 is used for the message sizes between 3201 and 5000 bytes, and algorithm 3 is used for all other messages.

## I\_MPI\_ADJUST\_<opname>\_LIST

### Syntax

```
I_MPI_ADJUST_<opname>_LIST=<algid1>[-<algid2>][,<algid3>][,<algid4>-<algid5>]
```

### Description

Set this environment variable to specify the set of algorithms to be considered by the Intel MPI runtime for a specified <opname>. This variable is useful in autotuning scenarios, as well as tuning scenarios where users would like to select a certain subset of algorithms.

---

**NOTE** Setting an empty string disables autotuning for the <opname> collective.

---

## I\_MPI\_COLL\_INTRANODE

### Syntax

```
I_MPI_COLL_INTRANODE=<mode>
```

### Arguments

<mode>	Intranode collectives type
pt2pt	Use only point-to-point communication-based collectives
shm	Enables shared memory collectives. This is the default value

---

## Description

Set this environment variable to switch intranode communication type for collective operations. If there is large set of communicators, you can switch off the SHM-collectives to avoid memory overconsumption.

## I\_MPI\_COLL\_INTRANODE\_SHM\_THRESHOLD

### Syntax

I\_MPI\_COLL\_INTRANODE\_SHM\_THRESHOLD=<nbytes>

### Arguments

<nbytes>	Define the maximal data block size processed by shared memory collectives.
> 0	Use the specified size. The default value is 16384 bytes.

## Description

Set this environment variable to define the size of shared memory area available for each rank for data placement. Messages greater than this value will *not* be processed by SHM-based collective operation, but will be processed by point-to-point based collective operation. The value must be a multiple of 4096.

## I\_MPI\_COLL\_EXTERNAL

### Syntax

I\_MPI\_COLL\_EXTERNAL=<arg>

### Arguments

<arg>	Binary indicator.
enable   yes   on   1	Enable the external collective operations functionality.
disable   no   off   0	Disable the external collective operations functionality. This is the default value.

## Description

Set this environment variable to enable external collective operations. The mechanism allows to enable HCOLL. The functionality enables the following collective operations: I\_MPI\_ADJUST\_ALLREDUCE=24, I\_MPI\_ADJUST\_BARRIER=11, I\_MPI\_ADJUST\_BCAST=16, I\_MPI\_ADJUST\_REDUCE=13, I\_MPI\_ADJUST\_ALLGATHER=6, I\_MPI\_ADJUST\_ALLTOALL=5, I\_MPI\_ADJUST\_ALLTOALLV=5, I\_MPI\_ADJUST\_SCAN=3, I\_MPI\_ADJUST\_EXSCAN=3, I\_MPI\_ADJUST\_GATHER=5, I\_MPI\_ADJUST\_GATHERV=4, I\_MPI\_ADJUST\_SCATTER=5, I\_MPI\_ADJUST\_SCATTERV=4, I\_MPI\_ADJUST\_ALLGATHERV=5, I\_MPI\_ADJUST\_ALLTOALLW=2, I\_MPI\_ADJUST\_REDUCE\_SCATTER=6, I\_MPI\_ADJUST\_REDUCE\_SCATTER\_BLOCK=4, I\_MPI\_ADJUST\_IALLGATHER=5, I\_MPI\_ADJUST\_IALLGATHERV=5, I\_MPI\_ADJUST\_IGATHERV=3, I\_MPI\_ADJUST\_IALLREDUCE=9, I\_MPI\_ADJUST\_IALLTOALLV=2, I\_MPI\_ADJUST\_IBARRIER=2, I\_MPI\_ADJUST\_IBCAST=5, I\_MPI\_ADJUST\_IREDUCE=4.

## I\_MPI\_CBWR

Control reproducibility of floating-point operations results across different platforms, networks, and topologies in case of the same number of processes.

## Syntax

`I_MPI_CBWR=<arg>`

## Arguments

<code>&lt;arg&gt;</code>	CBWR compatibility mode	Description
0	None	Do not use CBWR in a library-wide mode. CNR-safe communicators may be created with <code>MPI_Comm_dup_with_info</code> explicitly. This is the default value.
1	Weak mode	Disable topology aware collectives. The result of a collective operation does not depend on the rank placement. The mode guarantees results reproducibility across different runs on the same cluster (independent of the rank placement).
2	Strict mode	Disable topology aware collectives, ignore CPU architecture, and interconnect during algorithm selection. The mode guarantees results reproducibility across different runs on different clusters (independent of the rank placement, CPU architecture, and interconnection)

## Description

Conditional Numerical Reproducibility (CNR) provides controls for obtaining reproducible floating-point results on collectives operations. With this feature, Intel MPI collective operations are designed to return the same floating-point results from run to run in case of the same number of MPI ranks.

Control this feature with the `I_MPI_CBWR` environment variable in a library-wide manner, where all collectives on all communicators are guaranteed to have reproducible results. To control the floating-point operations reproducibility in a more precise and per-communicator way, pass the `{"I_MPI_CBWR", "yes"}` key-value pair to the `MPI_Comm_dup_with_info` call.

### NOTE

Setting the `I_MPI_CBWR` in a library-wide mode using the environment variable leads to performance penalty.

CNR-safe communicators created using `MPI_Comm_dup_with_info` always work in the strict mode. For example:

```
MPI_Info hint;
MPI_Comm cbwr_safe_world, cbwr_safe_copy;
MPI_Info_create(&hint);
MPI_Info_set(hint, "I_MPI_CBWR", "yes");
MPI_Comm_dup_with_info(MPI_COMM_WORLD, hint, & cbwr_safe_world);
MPI_Comm_dup(cbwr_safe_world, & cbwr_safe_copy);
```

---

In the example above, both `cbwr_safe_world` and `cbwr_safe_copy` are CNR-safe. Use `cbwr_safe_world` and its duplicates to get reproducible results for critical operations.

Note that `MPI_COMM_WORLD` itself may be used for performance-critical operations without reproducibility limitations.

## Tuning Environment Variables

---

### `I_MPI_TUNING_MODE`

Select the tuning method.

#### Syntax

`I_MPI_TUNING_MODE=<arg>`

#### Argument

<i>&lt;arg&gt;</i>	Description
<i>none</i>	Disable tuning modes. This is the default value.
<i>auto</i>	Enable autotuner.
<i>auto:application</i>	Enable autotuner with application focused strategy (alias for <i>auto</i> ).
<i>auto:cluster</i>	Enable autotuner without application specific logic. This is typically performed with the help of benchmarks (for example, IMB-MPI1) and proxy applications.

#### Description

Set this environment variable to enable the autotuner functionality and set the autotuner strategy.

### `I_MPI_TUNING_BIN`

Specify the path to tuning settings in a binary format.

#### Syntax

`I_MPI_TUNING_BIN=<path>`

#### Argument

<i>&lt;path&gt;</i>	A path to a binary file with tuning settings. By default, Intel® MPI Library uses the binary tuning file located at <code>&lt;\$I_MPI_ROOT/etc&gt;</code> .
---------------------	---

#### Description

Set this environment variable to load tuning settings in a binary format.

### `I_MPI_TUNING_BIN_DUMP`

Specify the file for storing tuning settings in a binary format.

#### Syntax

`I_MPI_TUNING_BIN_DUMP=<filename>`

## Argument

`<filename>`

A file name of a binary that stores tuning settings. By default, the path is not specified.

## Description

Set this environment variable to store tuning settings in a binary format.

`I_MPI_TUNING`

Load tuning settings in a JSON format.

## Syntax

`I_MPI_TUNING=<path>`

## Argument

`<path>`

A path to a JSON file with tuning settings.

## Description

Set this environment variable to load tuning settings in a JSON format.

Note: The tuning settings in the JSON format are produced by the [mpitune](#) utility.

By default, Intel® MPI library loads tuning settings in a binary format. If it is not possible, Intel MPI Library loads the tuning file in a JSON format specified through the `I_MPI_TUNING` environment variable.

Thus, to enable JSON tuning, turn off the default binary tuning: `I_MPI_BIN=""`. If it is not possible to load tuning settings from a JSON file and in a binary format, the default tuning values are used.

You do not need to turn off binary or JSON tuning settings if you use `I_MPI_ADJUST` family environment variables. The algorithms specified with `I_MPI_ADJUST` environment variables always have priority over binary and JSON tuning settings.

## See Also

[Autotuning](#)

[Environment Variables for Autotuning](#)

## Autotuning

Tuning is very dependent on the specifications of the particular platform. Intel carefully determines the tuning parameters for a limited set of platforms, and makes them available for autotuning using the `I_MPI_TUNING_MODE` environment variable.

For the full list of platforms supported by the `I_MPI_TUNING_MODE` environment variable, see [Tuning Environment Variables](#). This variable has no effect on platforms not included in this list. For these platforms, use the [I\\_MPI\\_TUNING\\_AUTO Family Environment Variables](#) directly to find the best settings.

The autotuner functionality lets you automatically find the best algorithms for collective operations. The autotuner search space can be modified by `I_MPI_ADJUST_<opname>_LIST` variables from [I\\_MPI\\_ADJUST Family Environment Variables](#).

The collectives currently available for autotuning are: `MPI_Allreduce`, `MPI_Bcast`, `MPI_Barrier`, `MPI_Reduce`, `MPI_Gather`, `MPI_Scatter`, `MPI_Alltoall`, `MPI_Allgatherv`, `MPI_Reduce_scatter`, `MPI_Reduce_scatter_block`, `MPI_Scan`, `MPI_Exscan`, `MPI_Iallreduce`, `MPI_Ibcast`, `MPI_Ibarrier`, `MPI_Ireduce`, `MPI_Igather`, `MPI_Iscatter`, `MPI_Ialltoall`, `MPI_Iallgatherv`, `MPI_Ireduce_scatter`, `MPI_Ireduce_scatter_block`, `MPI_Iscan`, and `MPI_Iexscan`.

To get started with autotuning, follow these steps:

1. Launch the application with the autotuner enabled and specify the dump file, which stores results:

```
I_MPI_TUNING_MODE=auto I_MPI_TUNING_BIN_DUMP=<tuning_results.dat>
```

2. Launch the application with the tuning results generated at the previous step:

```
I_MPI_TUNING_BIN=<tuning_results.dat>
```

Or use the `-tune Hydra` option.

3. If you experience performance issues, see [Environment Variables for Autotuning](#).

For example:

```
1$ export I_MPI_TUNING_MODE=auto
$ export I_MPI_TUNING_AUTO_SYNC=1
$ export I_MPI_TUNING_AUTO_ITER_NUM=5
$ export I_MPI_TUNING_BIN_DUMP=./tuning_results.dat
$ mpirun -n 128 -ppn 64 IMB-MPI1 allreduce -iter 1000,800 -time 4800
2$ export I_MPI_TUNING_BIN=./tuning_results.dat
$ mpirun -n 128 -ppn 64 IMB-MPI1 allreduce -iter 1000,800 -time 4800
```

---

**NOTE**

To tune collectives on a communicator identified with the help of Application Performance Snapshot (APS), execute the following variable at step 1: `I_MPI_TUNING_AUTO_COMM_LIST=comm_id_1, ... , comm_id_n`.

---

## I\_MPI\_TUNING\_AUTO Family Environment Variables

### I\_MPI\_TUNING\_AUTO\_STORAGE\_SIZE

Define size of the per-communicator tuning storage.

#### Syntax

```
I_MPI_TUNING_AUTO_STORAGE_SIZE=<size>
```

#### Argument

<code>&lt;size&gt;</code>	Specify size of the communicator tuning storage. The default size of the storage is 512 Kb.
---------------------------	---

#### Description

Set this environment variable to change the size of the communicator tuning storage.

### I\_MPI\_TUNING\_AUTO\_ITER\_NUM

Specify the number of autotuner iterations.

#### Syntax

```
I_MPI_TUNING_AUTO_ITER_NUM=<number>
```

## Argument

<code>&lt;number&gt;</code>	Define the number of iterations. By default, it is 1.
-----------------------------	---

## Description

Set this environment variable to specify the number of autotuner iterations. The greater iteration number produces more accurate results.

### NOTE

To check if all possible algorithms are iterated, make sure that the total number of collective invocations for a particular message size in a target application is at least equal the value of `I_MPI_TUNING_AUTO_ITER_NUM` multiplied by the number of algorithms.

## I\_MPI\_TUNING\_AUTO\_WARMUP\_ITER\_NUM

Specify the number of warmup autotuner iterations.

## Syntax

`I_MPI_TUNING_AUTO_WARMUP_ITER_NUM=<number>`

## Argument

<code>&lt;number&gt;</code>	Define the number of iterations. By default, it is 1.
-----------------------------	---

## Description

Set this environment variable to specify the number of autotuner warmup iterations. Warmup iterations do not impact autotuner decisions and allow to skip additional iterations, such as infrastructure preparation.

## I\_MPI\_TUNING\_AUTO\_SYNC

Enable the internal barrier on every iteration of the autotuner.

## Syntax

`I_MPI_TUNING_AUTO_SYNC=<arg>`

## Argument

<code>&lt;arg&gt;</code>	Binary indicator
<code>enable   yes   on   1</code>	Align the autotuner with the IMB measurement approach.
<code>disable   no   off   0</code>	Do not use the barrier on every iteration of the autotuner. This is the default value.

## Description

Set this environment variable to control the IMB measurement logic. Setting this variable to 1 may lead to overhead due to an additional `MPI_Barrier` call.

## I\_MPI\_TUNING\_AUTO\_COMM\_LIST

Control the scope of autotuning.

## Syntax

`I_MPI_TUNING_AUTO_COMM_LIST=<comm_id_1, ..., comm_id_n>`

## Argument

`<comm_id_n, ...>`

Specify communicators to be tuned.

## Description

Set this environment variable to specify communicators to be tuned using their unique id. By default, the variable is not specified. In this case, all communicators in the application are involved into the tuning process.

Note: To get the list of communicators available for tuning, use the [Application Performance Snapshot \(APS\)](#) tool, which supports per communicator profiling starting with the 2019 Update 4 release.

For example:

1. Source `apsvars.sh`:

```
$ source <path_to_aps>/apsvars.sh
```

2. Gather APS statistics:

```
$ export MPS_STAT_LEVEL=5
$ export APS_COLLECT_COMM_IDS=1
mpirun -aps -n 128 -ppn 64 IMB-MPI1 allreduce -npmin 128 -iter 1000,800 -time 4800
```

3. Generate an APS report:

```
$ aps-report aps_result_20190228/ -lFE
```

4. Get the results:

```
| Communicators used in the application
|-----|
| Communicator Id      Communicator Size      Time (Rank Average) (sec)  Ranks
|-----|-----|-----|
| 4611686018431582688  4              1.80 (0.45)              0,1,2,3
|-----|-----|-----|
| 4611686018431582208  4              0.59 (0.15)              0,1,2,3
|-----|-----|-----|
| 4611686018429485552  2              0.51 (0.25)              0,1
|-----|-----|-----|
| 4611686018429485520  2              0.01 (0.00)              0,1
|-----|-----|-----|
| 4611686018431582672  4              0.00 (0.00)              0,1,2,3
|-----|-----|-----|
```

5. Specify the communicators to be tuned:

```
$ export I_MPI_TUNING_AUTO_COMM_LIST=4611686018431582688
$ export MPS_STAT_LEVEL=5
$ export APS_COLLECT_COMM_IDS=1
$ export I_MPI_TUNING_AUTO=1
$ mpirun -aps -n 128 -ppn 64 IMB-MPI1 allreduce -iter 1000,800 -time 4800
```

## `I_MPI_TUNING_AUTO_COMM_DEFAULT`

Mark all communicators with the default value.

## Syntax

`I_MPI_TUNING_AUTO_COMM_DEFAULT=<arg>`

## Argument

<code>&lt;arg&gt;</code>	Binary indicator
<code>enable   yes   on   1</code>	Mark communicators.
<code>disable   no   off   0</code>	Do not mark communicators. This is the default value.

## Description

Set this environment variable to mark all communicators in an application with the default value. In this case, all communicators will have the identical default `comm_id` equal to -1.

## I\_MPI\_TUNING\_AUTO\_COMM\_USER

Enable communicator marking with a user value.

## Syntax

`I_MPI_TUNING_AUTO_COMM_USER=<arg>`

## Argument

<code>&lt;arg&gt;</code>	Binary indicator
<code>enable   yes   on   1</code>	Enable marking of communicators.
<code>disable   no   off   0</code>	Disable marking of communicators. This is the default value.

## Description

Set this environment variable to enable communicator marking with a user value. To mark a communicator in your application, use the `MPI_Info` object for this communicator that contains a record with the `comm_id` key. The key must belong the `0...UINT64_MAX` range.

## I\_MPI\_TUNING\_AUTO\_ITER\_POLICY

Control the iteration policy logic.

## Syntax

`_MPI_TUNING_AUTO_ITER_POLICY=<arg>`

## Argument

<code>&lt;arg&gt;</code>	Binary indicator
<code>enable   yes   on   1</code>	Reduce the number of iterations with a message size increase after 64Kb (by half). This is the default value.
<code>disable   no   off   0</code>	Use the <code>I_MPI_TUNING_AUTO_ITER_NUM</code> value. This value affects warmup iterations.

## Description

Set this environment variable to control the autotuning iteration policy logic.

---

## I\_MPI\_TUNING\_AUTO\_ITER\_POLICY\_THRESHOLD

Control the message size limit for the I\_MPI\_TUNING\_AUTO\_ITER\_POLICY environment variable.

### Syntax

I\_MPI\_TUNING\_AUTO\_ITER\_POLICY\_THRESHOLD=<arg>

### Argument

<arg>

Define the value. By default, it is 64KB.

### Description

Set this environment variable to control the message size limit for the autotuning iteration policy logic (I\_MPI\_TUNING\_AUTO\_ITER\_POLICY).

## I\_MPI\_TUNING\_AUTO\_POLICY

Choose the best algorithm identification strategy.

### Syntax

I\_MPI\_TUNING\_AUTO\_POLICY=<arg>

### Argument

<arg>

#### Description

max

Choose the best algorithm based on a maximum time value. This is the default value.

min

Choose the best algorithm based on a minimum time value.

avg

Choose the best algorithm based on an average time value.

### Description

Set this environment variable to control the autotuning strategy and choose the best algorithm based on the time value across ranks involved into the tuning process.

---

## Main ThreadProcess Pinning

Use this feature to pin a particular MPI process to a corresponding set of CPUs within a node and avoid undesired process migration. This feature is available on operating systems that provide the necessary kernel interfaces.

This page describes the pinning process. You can simulate your pinning configuration using the [Pinning Simulator for Intel MPI Library](#).

### Processor Identification

The following schemes are used to identify logical processors in a system:

- System-defined logical enumeration
- Topological enumeration based on three-level hierarchical identification through triplets (package/socket, core, thread)

The number of a logical CPU is defined as the corresponding position of this CPU bit in the kernel affinity bit-mask. Use the `cpuinfo` utility, provided with your Intel MPI Library installation or the `cat /proc/cpuinfo` command to find out the logical CPU numbers.

The three-level hierarchical identification uses triplets that provide information about processor location and their order. The triplets are hierarchically ordered (package, core, and thread).

See the example for one possible processor numbering where there are two sockets, four cores (two cores per socket), and eight logical processors (two processors per core).

Note

Logical and topological enumerations are not the same.

#### Logical Enumeration

0	4	1	5	2	6	3	7
---	---	---	---	---	---	---	---

#### Hierarchical Levels

Socket	0	0	0	0	1	1	1	1
Core	0	0	1	1	0	0	1	1
Thread	0	1	0	1	0	1	0	1

#### Topological Enumeration

0	1	2	3	4	5	6	7
---	---	---	---	---	---	---	---

Use the `cpuinfo` utility to identify the correspondence between the logical and topological enumerations. See [Processor Information Utility](#) for more details.

## Default Settings

If you do not specify values for any process pinning environment variables, the default settings below are used. For details about these settings, see [Environment Variables](#) and [Interoperability with OpenMP API](#).

- `I_MPI_PIN=on`
- `I_MPI_PIN_MODE=pm`
- `I_MPI_PIN_RESPECT_CPUSET=on`
- `I_MPI_PIN_RESPECT_HCA=on`
- `I_MPI_PIN_CELL=unit`
- `I_MPI_PIN_DOMAIN=auto:compact`
- `I_MPI_PIN_ORDER=compact`

### NOTE

If `I_MPI_PIN_ORDER` is not specified and one of the sockets (NUMA-nodes) is not used, for better performance the 'bunch' order will automatically be used instead of the default 'compact' order.

If hyperthreading is on, the number of processes on the node is greater than the number of cores and no one process pinning environment variable is set. For better performance, the "spread" order will automatically be used instead of the default "compact" order.

## Environment Variables for Main ThreadProcess Pinning

### `I_MPI_PIN`

Turn on/off process pinning.

---

## Syntax

`I_MPI_PIN=<arg>`

## Arguments

<code>&lt;arg&gt;</code>	Binary indicator
<code>enable   yes   on   1</code>	Enable process pinning. This is the default value
<code>disable   no   off   0</code>	Disable process pinning

## Description

Set this environment variable to control the process pinning feature of the Intel® MPI Library.

`I_MPI_PIN_PROCESSOR_LIST` (`I_MPI_PIN_PROCS`)

Define a processor subset and the mapping rules for MPI processes within this subset.

## Syntax

`I_MPI_PIN_PROCESSOR_LIST=<value>`

The environment variable value has the following syntax forms:

1. `<proclist>`
2. `[<procset>][:[grain=<grain>][,shift=<shift>][,preoffset=<preoffset>][,postoffset=<postoffset>]]`
3. `[<procset>][:map=<map>]`

The following paragraphs provide detail descriptions for the values of these syntax forms.

---

### NOTE

The `postoffset` keyword has `offset` alias.

The second form of the pinning procedure has three steps:

1. Cyclic shift of the source processor list on `preoffset*grain` value.
2. Round robin shift of the list derived on the first step on `shift*grain` value.
3. Cyclic shift of the list derived on the second step on the `postoffset*grain` value.

The `grain`, `shift`, `preoffset`, and `postoffset` parameters have a unified definition style.

This environment variable is available for both Intel® and non-Intel microprocessors, but it may perform additional optimizations for Intel microprocessors than it performs for non-Intel microprocessors.

---

## Syntax

`I_MPI_PIN_PROCESSOR_LIST=<proclist>`

## Arguments

<code>&lt;proclist&gt;</code>	A comma-separated list of logical processor numbers and/or ranges of processors. The process with the i-th rank is pinned to the i-th processor in the list. The number should not exceed the amount of processors on a node.
<code>&lt;/&gt;</code>	Processor with logical number <code>&lt;1&gt;</code> .

<code>&lt;/&gt;-&lt;m&gt;</code>	Range of processors with logical numbers from <code>&lt;l&gt;</code> to <code>&lt;m&gt;</code> .
<code>&lt;k&gt;,&lt;/&gt;-&lt;m&gt;</code>	Processors <code>&lt;k&gt;</code> , as well as <code>&lt;l&gt;</code> through <code>&lt;m&gt;</code> .

## Syntax

```
I_MPI_PIN_PROCESSOR_LIST=[<procset>][:[grain=<grain>][,shift=<shift>]
[,preoffset=<preoffset>][,postoffset=<postoffset>]
```

## Arguments

<code>&lt;procset&gt;</code>	Specify a processor subset based on the topological numeration. The default value is <code>allcores</code> .
<code>all</code>	All logical processors. Specify this subset to define the number of CPUs on a node.
<code>allcores</code>	All cores (physical CPUs). Specify this subset to define the number of cores on a node. This is the default value.
	If Intel® Hyper-Threading Technology is disabled, <code>allcores</code> equals to <code>all</code> .
<code>allsockets</code>	All packages/sockets. Specify this subset to define the number of sockets on a node.
<code>&lt;grain&gt;</code>	Specify the pinning granularity cell for a defined <code>&lt;procset&gt;</code> . The minimal <code>&lt;grain&gt;</code> value is a single element of the <code>&lt;procset&gt;</code> . The maximal <code>&lt;grain&gt;</code> value is the number of <code>&lt;procset&gt;</code> elements in a socket. The <code>&lt;grain&gt;</code> value must be a multiple of the <code>&lt;procset&gt;</code> value. Otherwise, the minimal <code>&lt;grain&gt;</code> value is assumed. The default value is the minimal <code>&lt;grain&gt;</code> value.
<code>&lt;shift&gt;</code>	Specify the granularity of the round robin scheduling shift of the cells for the <code>&lt;procset&gt;</code> . <code>&lt;shift&gt;</code> is measured in the defined <code>&lt;grain&gt;</code> units. The <code>&lt;shift&gt;</code> value must be positive integer. Otherwise, no shift is performed. The default value is no shift, which is equal to 1 normal increment.
<code>&lt;preoffset&gt;</code>	Specify the cyclic shift of the processor subset <code>&lt;procset&gt;</code> defined before the round robin shifting on the <code>&lt;preoffset&gt;</code> value. The value is measured in the defined <code>&lt;grain&gt;</code> units. The <code>&lt;preoffset&gt;</code> value must be non-negative integer. Otherwise, no shift is performed. The default value is no shift.
<code>&lt;postoffset&gt;</code>	Specify the cyclic shift of the processor subset <code>&lt;procset&gt;</code> derived after round robin shifting on the <code>&lt;postoffset&gt;</code> value. The value is measured in the defined <code>&lt;grain&gt;</code> units. The <code>&lt;postoffset&gt;</code> value must be non-negative integer. Otherwise no shift is performed. The default value is no shift.

The following table displays the values for `<grain>`, `<shift>`, `<preoffset>`, and `<postoffset>` options:

<code>&lt;n&gt;</code>	Specify an explicit value of the corresponding parameters. <code>&lt;n&gt;</code> is non-negative integer.
<code>fine</code>	Specify the minimal value of the corresponding parameter.
<code>core</code>	Specify the parameter value equal to the amount of the corresponding parameter units contained in one core.
<code>cache1</code>	Specify the parameter value equal to the amount of the corresponding parameter units that share an L1 cache.
<code>cache2</code>	Specify the parameter value equal to the amount of the corresponding parameter units that share an L2 cache.
<code>cache3</code>	Specify the parameter value equal to the amount of the corresponding parameter units that share an L3 cache.
<code>cache</code>	The largest value among <code>cache1</code> , <code>cache2</code> , and <code>cache3</code> .
<code>socket</code>   <code>sock</code>	Specify the parameter value equal to the amount of the corresponding parameter units contained in one physical package/socket.
<code>half</code>   <code>mid</code>	Specify the parameter value equal to <code>socket/2</code> .
<code>third</code>	Specify the parameter value equal to <code>socket/3</code> .
<code>quarter</code>	Specify the parameter value equal to <code>socket/4</code> .
<code>octavo</code>	Specify the parameter value equal to <code>socket/8</code> .

## Syntax

`I_MPI_PIN_PROCESSOR_LIST=[<procset>] [:map=<map>]`

## Arguments

<code>&lt;map&gt;</code>	The mapping pattern used for process placement.
<code>bunch</code>	The processes are mapped as close as possible on the sockets.
<code>scatter</code>	The processes are mapped as remotely as possible so as not to share common resources: FSB, caches, and core.
<code>spread</code>	The processes are mapped consecutively with the possibility not to share common resources.

## Description

Set the `I_MPI_PIN_PROCESSOR_LIST` environment variable to define the processor placement. To avoid conflicts with different shell versions, the environment variable value may need to be enclosed in quotes.

### NOTE

This environment variable is valid only if `I_MPI_PIN` is enabled.

The `I_MPI_PIN_PROCESSOR_LIST` environment variable has the following different syntax variants:

- Explicit processor list. This comma-separated list is defined in terms of logical processor numbers. The relative node rank of a process is an index to the processor list such that the *i*-th process is pinned on *i*-th list member. This permits the definition of any process placement on the CPUs.

For example, process mapping for `I_MPI_PIN_PROCESSOR_LIST=p0,p1,p2,...,pn` is as follows:

Rank on a node	0	1	2	...	n-1	N
Logical CPU	p0	p1	p2	...	pn-1	Pn

- `grain/shift/offset` mapping. This method provides cyclic shift of a defined `grain` along the processor list with steps equal to `shift*grain` and a single shift on `offset*grain` at the end. This shifting action is repeated `shift` times.

For example: `grain = 2` logical processors, `shift = 3` grains, `offset = 0`.

Legend:

gray - MPI process grains

A) red - processor grains chosen on the 1<sup>st</sup> pass

B) cyan - processor grains chosen on the 2<sup>nd</sup> pass

C) green - processor grains chosen on the final 3<sup>rd</sup> pass

D) Final map table ordered by MPI ranks

A)

0 1			2 3			...		2n-2		
								2n-1		
0 1	2 3	4 5	6 7	8 9	10 11	...	6n-6	6n-4	6n-2	
							6n-5	6n-3	6n-1	

B)

0 1	2n 2n+1		2 3		2n+2 2n	...	2n-2	4n-2		
					+3		2n-1	4n-1		
0 1	2 3	4 5	6 7	8 9	10 11	...	6n-6	6n-4	6n-2	
							6n-5	6n-3	6n-1	

C)

0 1	2n 2n+1	4n 4n+1	2 3		2n+2 2n	4n+2 4n	...	2n-2	4n-2	6n-2
					+3	+3		2n-1	4n-1	6n-1
0 1	2 3	4 5	6 7	8 9	10 11	...	6n-6	6n-4	6n-2	
							6n-5	6n-3	6n-1	

D)

0 1	2 3	...	2n-2	2n 2n	2n+2	...	4n-2	4n 4n	4n+2	...	6n-2
			2n-1	+1	2n+3		4n-1	+1	4n+3		6n-1
0 1	6 7	...	6n-6	2 3	8 9	...	6n-4	4 5	10 11	...	6n-2
			6n-5				6n-3				6n-1

- Predefined mapping scenario. In this case popular process pinning schemes are defined as keywords selectable at runtime. There are two such scenarios: `bunch` and `scatter`.

In the `bunch` scenario the processes are mapped proportionally to sockets as closely as possible. This mapping makes sense for partial processor loading. In this case the number of processes is less than the number of processors.

In the `scatter` scenario the processes are mapped as remotely as possible so as not to share common resources: FSB, caches, and cores.

In the example, there are two sockets, four cores per socket, one logical CPU per core, and two cores per shared cache.

Legend:

---

gray - MPI processes

cyan - 1<sup>st</sup> socket processors

green - 2<sup>nd</sup> socket processors

Same color defines a processor pair sharing a cache

0	1	2		3	4		
0	1	2	3	4	5	6	7

bunch scenario for 5 processes

0	4	2	6	1	5	3	7
0	1	2	3	4	5	6	7

scatter scenario for full loading

## Examples

To pin the processes to CPU0 and CPU3 on each node globally, use the following command:

```
$ mpirun -genv I_MPI_PIN_PROCESSOR_LIST=0,3 -n <# of processes><executable>
```

To pin the processes to different CPUs on each node individually (CPU0 and CPU3 on host1 and CPU0, CPU1 and CPU3 on host2), use the following command:

```
$ mpirun -host host1 -env I_MPI_PIN_PROCESSOR_LIST=0,3 -n <# of processes> <executable> : \
-host host2 -env I_MPI_PIN_PROCESSOR_LIST=1,2,3 -n <# of processes> <executable>
```

To print extra debug information about process pinning, use the following command:

```
$ mpirun -genv I_MPI_DEBUG=4 -m -host host1 \
-env I_MPI_PIN_PROCESSOR_LIST=0,3 -n <# of processes> <executable> :\
-host host2 -env I_MPI_PIN_PROCESSOR_LIST=1,2,3 -n <# of processes> <executable>
```

---

### NOTE

If the number of processes is greater than the number of CPUs used for pinning, the process list is wrapped around to the start of the processor list.

---

## Syntax

`I_MPI_PIN_PROCESSOR_EXCLUDE_LIST=<proclist>`

## Arguments

<code>&lt;proclist&gt;</code>	A comma-separated list of logical processor numbers and/or ranges of processors.
<code>&lt;l&gt;</code>	Processor with logical number <code>&lt;l&gt;</code> .
<code>&lt;l&gt;-&lt;m&gt;</code>	Range of processors with logical numbers from <code>&lt;l&gt;</code> to <code>&lt;m&gt;</code> .
<code>&lt;k&gt;, &lt;l&gt;-&lt;m&gt;</code>	Processors <code>&lt;k&gt;</code> , as well as <code>&lt;l&gt;</code> through <code>&lt;m&gt;</code> .

## Description

Set this environment variable to define the logical processors that Intel® MPI Library does not use for pinning capability on the intended hosts. Logical processors are numbered as in `/proc/cpuinfo`.

`I_MPI_PIN_CELL`

Set this environment variable to define the pinning resolution granularity. `I_MPI_PIN_CELL` specifies the minimal processor cell allocated when an MPI process is running.

### Syntax

`I_MPI_PIN_CELL=<cell>`

### Arguments

<code>&lt;cell&gt;</code>	Specify the resolution granularity
<code>unit</code>	Basic processor unit (logical CPU)
<code>core</code>	Physical processor core

### Description

Set this environment variable to define the processor subset used when a process is running. You can choose from two scenarios:

- all possible CPUs in a node (`unit` value)
- all cores in a node (`core` value)

The environment variable has effect on both pinning types:

- one-to-one pinning through the `I_MPI_PIN_PROCESSOR_LIST` environment variable
- one-to-many pinning through the `I_MPI_PIN_DOMAIN` environment variable

The default value rules are:

- If you use `I_MPI_PIN_DOMAIN`, then the cell granularity is `unit`.
- If you use `I_MPI_PIN_PROCESSOR_LIST`, then the following rules apply:
  - When the number of processes is greater than the number of cores, the cell granularity is `unit`.
  - When the number of processes is equal to or less than the number of cores, the cell granularity is `core`.

#### NOTE

The `core` value is not affected by the enabling/disabling of Intel® Hyper-Threading Technology in a system.

`I_MPI_PIN_RESPECT_CPUSSET`

Respect the process affinity mask.

### Syntax

`I_MPI_PIN_RESPECT_CPUSSET=<value>`

### Arguments

<code>&lt;value&gt;</code>	Binary indicator
<code>enable   yes   on   1</code>	Respect the process affinity mask. This is the default value
<code>disable   no   off   0</code>	Do not respect the process affinity mask

---

## Description

If you set `I_MPI_PIN_RESPECT_CPUSET=enable`, the Hydra process launcher uses job manager's process affinity mask on each intended host to determine logical processors for applying Intel MPI Library pinning capability.

If you set `I_MPI_PIN_RESPECT_CPUSET=disable`, the Hydra process launcher uses its own process affinity mask to determine logical processors for applying Intel MPI Library pinning capability.

`I_MPI_PIN_RESPECT_HCA`

In the presence of Infiniband architecture\* host channel adapter (IBA\* HCA), adjust the pinning according to the location of IBA HCA.

## Syntax

`I_MPI_PIN_RESPECT_HCA=<value>`

## Arguments

<code>&lt;value&gt;</code>	Binary indicator
<code>enable   yes   on   1</code>	Use the location of IBA HCA if available. This is the default value
<code>disable   no   off   0</code>	Do not use the location of IBA HCA

## Description

If you set `I_MPI_PIN_RESPECT_HCA=enable`, the Hydra process launcher uses the location of IBA HCA on each intended host for applying Intel MPI Library pinning capability.

If you set `I_MPI_PIN_RESPECT_HCA=disable`, the Hydra process launcher does not use the location of IBA HCA on each intended host for applying Intel MPI Library pinning capability.

## Interoperability with OpenMP\* API

`I_MPI_PIN_DOMAIN`

Intel® MPI Library provides an additional environment variable to control process pinning for hybrid MPI/OpenMP\* applications. This environment variable is used to define a number of non-overlapping subsets (domains) of logical processors on a node, and a set of rules on how MPI processes are bound to these domains by the following formula: *one MPI process per one domain*. See the picture below.

Figure 1 Domain Example

Each MPI process can create a number of children threads for running within the corresponding domain. The process threads can freely migrate from one logical processor to another within the particular domain.

If the `I_MPI_PIN_DOMAIN` environment variable is defined, then the `I_MPI_PIN_PROCESSOR_LIST` environment variable setting is ignored.

If the `I_MPI_PIN_DOMAIN` environment variable is not defined, then MPI processes are pinned according to the current value of the `I_MPI_PIN_PROCESSOR_LIST` environment variable.

The `I_MPI_PIN_DOMAIN` environment variable has the following syntax forms:

- Domain description through multi-core terms `<mc-shape>`
- Domain description through domain size and domain member layout `<size>[:<layout>]`
- Explicit domain description through bit mask `<masklist>`

The following tables describe these syntax forms.

#### Multi-core Shape

`I_MPI_PIN_DOMAIN=<mc-shape>`

<code>&lt;mc-shape&gt;</code>	Define domains through multi-core terms.
<code>core</code>	Each domain consists of the logical processors that share a particular core. The number of domains on a node is equal to the number of cores on the node.
<code>socket   sock</code>	Each domain consists of the logical processors that share a particular socket. The number of domains on a node is equal to the number of sockets on the node. This is the recommended value.
<code>numa</code>	Each domain consists of the logical processors that share a particular NUMA node. The number of domains on a machine is equal to the number of NUMA nodes on the machine.
<code>node</code>	All logical processors on a node are arranged into a single domain.
<code>cache1</code>	Logical processors that share a particular level 1 cache are arranged into a single domain.
<code>cache2</code>	Logical processors that share a particular level 2 cache are arranged into a single domain.
<code>cache3</code>	Logical processors that share a particular level 3 cache are arranged into a single domain.
<code>cache</code>	The largest domain among <code>cache1</code> , <code>cache2</code> , and <code>cache3</code> is selected.

---

**NOTE**

If `Cluster on Die` is disabled on a machine, the number of NUMA nodes equals to the number of sockets. In this case, pinning for `I_MPI_PIN_DOMAIN = numa` is equivalent to pinning for `I_MPI_PIN_DOMAIN = socket`.

**Explicit Shape**

`I_MPI_PIN_DOMAIN=<size>[:<layout>]`

---

<code>&lt;size&gt;</code>	Define a number of logical processors in each domain (domain size)
<code>omp</code>	The domain size is equal to the <code>OMP_NUM_THREADS</code> environment variable value. If the <code>OMP_NUM_THREADS</code> environment variable is not set, each node is treated as a separate domain.
<code>auto</code>	The domain size is defined by the formula <code>size=#cpu/#proc</code> , where <code>#cpu</code> is the number of logical processors on a node, and <code>#proc</code> is the number of the MPI processes started on a node
<code>&lt;n&gt;</code>	The domain size is defined by a positive decimal number <code>&lt;n&gt;</code>

<code>&lt;layout&gt;</code>	Ordering of domain members. The default value is <code>compact</code>
<code>platform</code>	Domain members are ordered according to their BIOS numbering (platform-depended numbering)
<code>compact</code>	Domain members are located as close to each other as possible in terms of common resources (cores, caches, sockets, and so on). This is the default value
<code>scatter</code>	Domain members are located as far away from each other as possible in terms of common resources (cores, caches, sockets, and so on)

**Explicit Domain Mask**

`I_MPI_PIN_DOMAIN=<masklist>`

<code>&lt;masklist&gt;</code>	Define domains through the comma separated list of hexadecimal numbers (domain masks)
<code>[m<sub>1</sub>, ..., m<sub>n</sub>]</code>	For <code>&lt;masklist&gt;</code> , each <code>m<sub>i</sub></code> is a hexadecimal bit mask defining an individual domain. The following rule is used: the <i>i</i> <sup>th</sup> logical processor is included into the domain if the corresponding <code>m<sub>i</sub></code> value is set to 1. All remaining processors are put into a separate domain. BIOS numbering is used.

**NOTE**  
To ensure that your configuration in `<masklist>` is parsed correctly, use square brackets to enclose the domains specified by the `<masklist>`. For example:  
`I_MPI_PIN_DOMAIN=[55,aa]`

---

**NOTE**

These options are available for both Intel® and non-Intel microprocessors, but they may perform additional optimizations for Intel microprocessors than they perform for non-Intel microprocessors.

To pin OpenMP\* processes or threads inside the domain, the corresponding OpenMP feature (for example, the `KMP_AFFINITY` environment variable for Intel® compilers) should be used.

---

**NOTE**

The following configurations are effectively the same as if pinning is not applied:

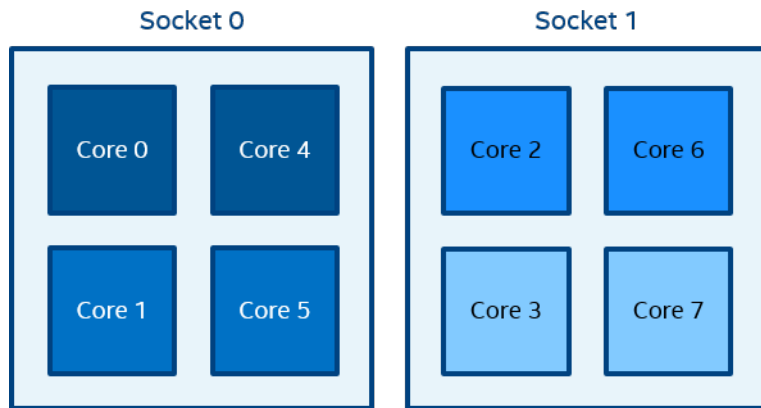

- If you set `I_MPI_PIN_DOMAIN=auto` and a single process is running on a node (for example, due to `I_MPI_PERHOST=1`)
- `I_MPI_PIN_DOMAIN=node`

If you do not want the process to be migrated between sockets on a multi-socket platform, specify the domain size as `I_MPI_PIN_DOMAIN=socket` or smaller.

You can also use `I_MPI_PIN_PROCESSOR_LIST`, which produces a single-cpu process affinity mask for each rank (the affinity mask is supposed to be automatically adjusted in presence of IBA\* HCA).

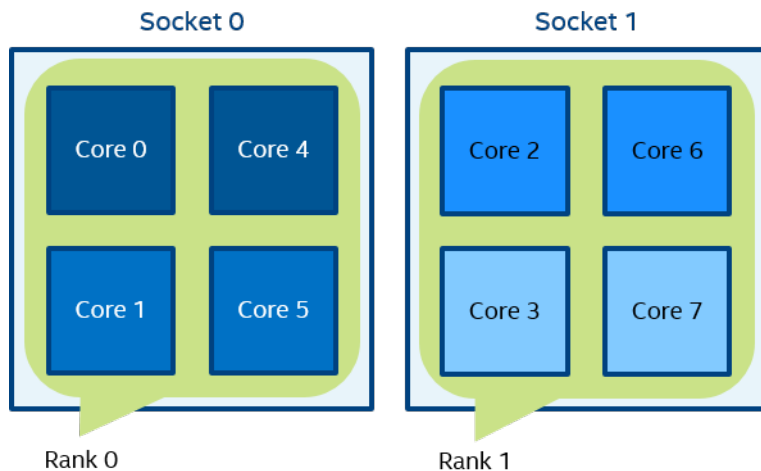

See the following model of a symmetric multiprocessing (SMP) node in the examples:

Figure 2 Model of a Node

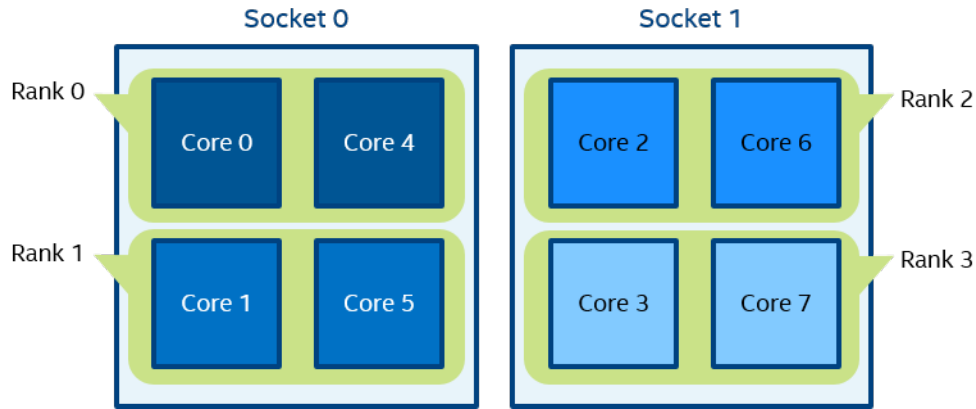

The figure above represents the SMP node model with a total of 8 cores on 2 sockets. Intel® Hyper-Threading Technology is disabled. Core pairs of the same color share the L2 cache.

Figure 3 `mpi run -n 2 -env I_MPI_PIN_DOMAIN socket ./a.out`

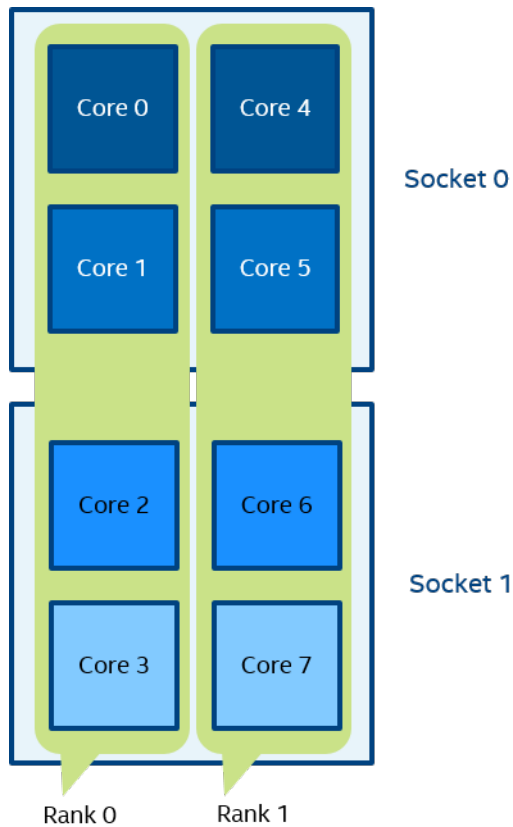

In Figure 3, two domains are defined according to the number of sockets. Process rank 0 can migrate on all cores on the 0-th socket. Process rank 1 can migrate on all cores on the first socket.

Figure 4 `mpi run -n 4 -env I_MPI_PIN_DOMAIN cache2 ./a.out`

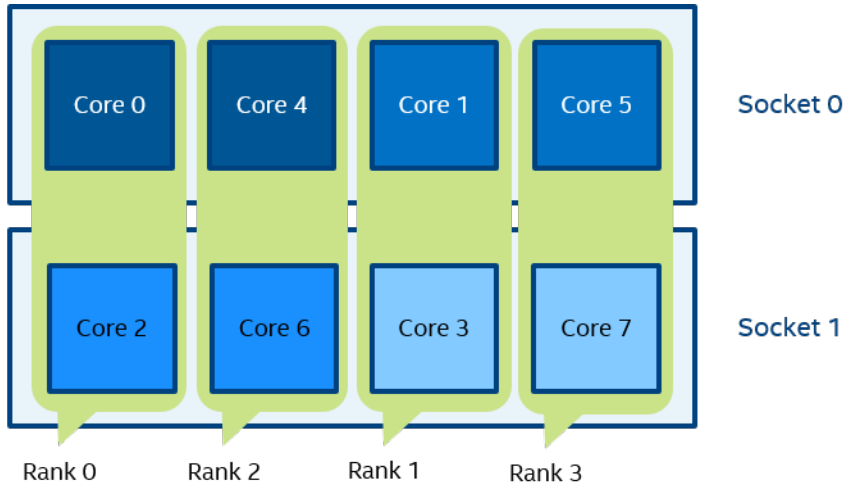

In Figure 4, four domains are defined according to the amount of common L2 caches. Process rank 0 runs on cores {0,4} that share an L2 cache. Process rank 1 runs on cores {1,5} that share an L2 cache as well, and so on.

Figure 5 `mpi run -n 2 -env I_MPI_PIN_DOMAIN 4:platform ./a.out`

In Figure 5, two domains with size=4 are defined. The first domain contains cores {0,1,2,3}, and the second domain contains cores {4,5,6,7}. Domain members (cores) have consecutive numbering as defined by the `platform` option.

Figure 6 `mpi run -n 4 -env I_MPI_PIN_DOMAIN auto:scatter ./a.out`

In Figure 6, domain size=2 (defined by the number of CPUs=8 / number of processes=4), `scatter` layout. Four domains  $\{0,2\}$ ,  $\{1,3\}$ ,  $\{4,6\}$ ,  $\{5,7\}$  are defined. Domain members do not share any common resources.

Figure 7 `setenv OMP_NUM_THREADS=2 mpi run -n 4 -env I_MPI_PIN_DOMAIN omp:platform ./a.out`

In Figure 7, domain size=2 (defined by `OMP_NUM_THREADS=2`), `platform` layout. Four domains  $\{0,1\}$ ,  $\{2,3\}$ ,  $\{4,5\}$ ,  $\{6,7\}$  are defined. Domain members (cores) have consecutive numbering.

Figure 8 `mpi run -n 2 -env I_MPI_PIN_DOMAIN [55,aa] ./a.out`

In Figure 8 (the example for `I_MPI_PIN_DOMAIN=<masklist>`), the first domain is defined by the 55 mask. It contains all cores with even numbers {0,2,4,6}. The second domain is defined by the AA mask. It contains all cores with odd numbers {1,3,5,7}.

#### I\_MPI\_PIN\_ORDER

Set this environment variable to define the mapping order for MPI processes to domains as specified by the `I_MPI_PIN_DOMAIN` environment variable.

#### Syntax

`I_MPI_PIN_ORDER=<order>`

#### Arguments

<code>&lt;order&gt;</code>	Specify the ranking order
<code>range</code>	The domains are ordered according to the processor's BIOS numbering. This is a platform-dependent numbering.
<code>scatter</code>	The domains are ordered so that adjacent domains have minimal sharing of common resources, whenever possible.
<code>compact</code>	The domains are ordered so that adjacent domains share common resources as much as possible. This is the default value.
<code>spread</code>	The domains are ordered consecutively with the possibility not to share common resources.
<code>bunch</code>	The processes are mapped proportionally to sockets and the domains are ordered as close as possible on the sockets.

#### Description

The optimal setting for this environment variable is application-specific. If adjacent MPI processes prefer to share common resources, such as cores, caches, sockets, FSB, use the `compact` or `bunch` values. Otherwise, use the `scatter` or `spread` values. Use the `range` value as needed. For detail information and examples about these values, see the Arguments table and the Example section of `I_MPI_PIN_ORDER` in this topic.

The options `scatter`, `compact`, `spread` and `bunch` are available for both Intel® and non-Intel microprocessors, but they may perform additional optimizations for Intel microprocessors than they perform for non-Intel microprocessors.

## Examples

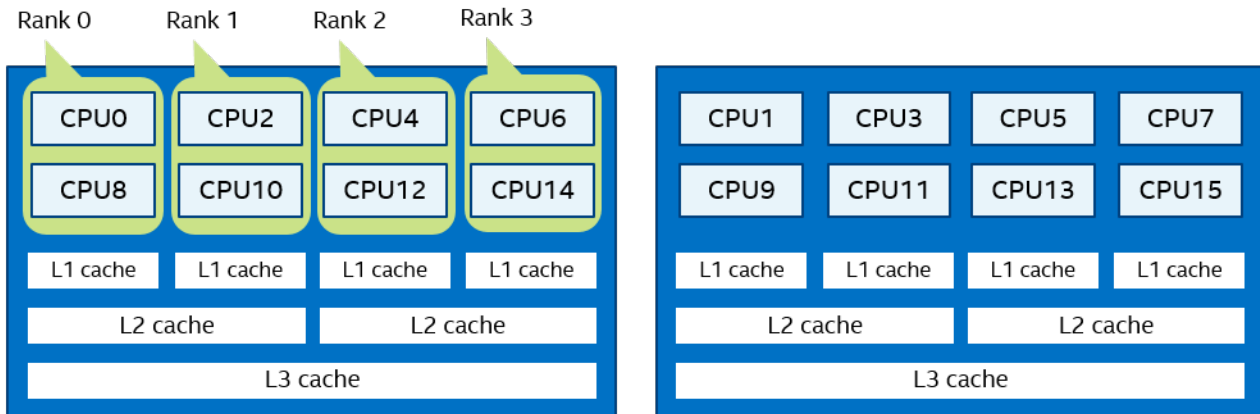

For the following configuration:

- Two socket nodes with four cores and a shared L2 cache for corresponding core pairs.
- 4 MPI processes you want to run on the node using the settings below.

### Compact order:

```
I_MPI_PIN_DOMAIN=2 I_MPI_PIN_ORDER=compact
```

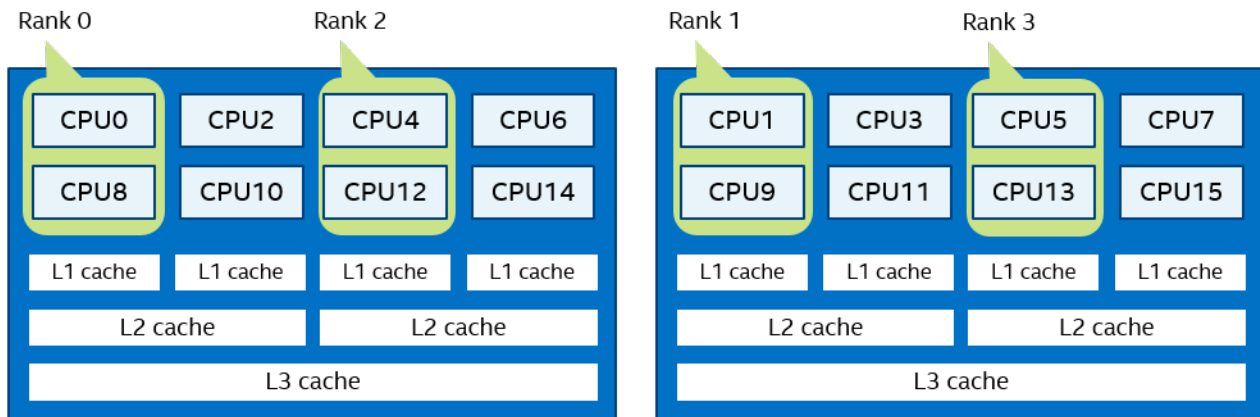

Figure 9 Compact Order Example

### Scatter order:

```
I_MPI_PIN_DOMAIN=2 I_MPI_PIN_ORDER=scatter
```

Figure 10 Scatter Order Example

### Spread order:

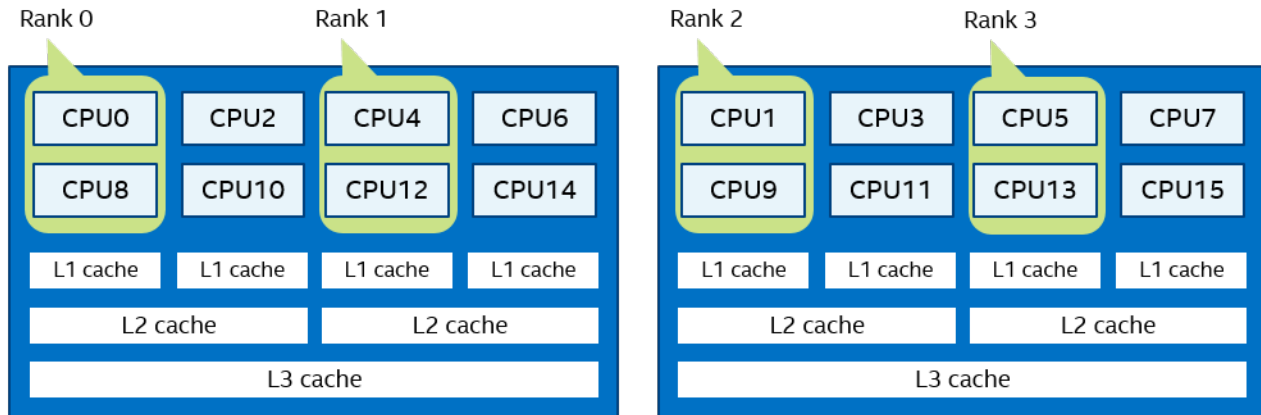

```
I_MPI_PIN_DOMAIN=2 I_MPI_PIN_ORDER=spread
```

#### NOTE

For `I_MPI_PIN_ORDER=spread`, the order will be switched to 'compact' if:

- there are not enough CPUs to emplace all domains
- different domains share the L1 cache

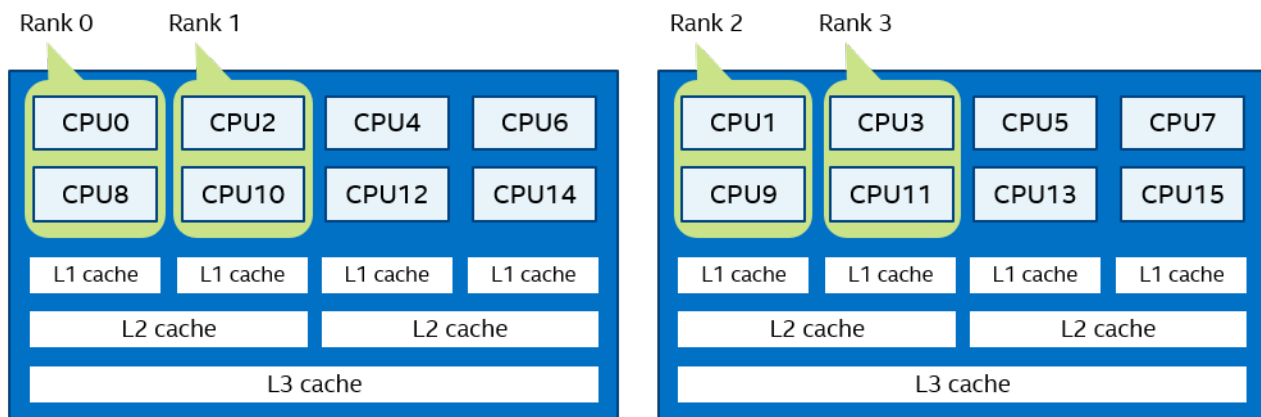

Figure 11 Spread Order Example

### Bunch order:

`I_MPI_PIN_DOMAIN=2 I_MPI_PIN_ORDER=bunch`

Figure 12 Bunch Order Example

## GPU Pinning

Use this feature to distribute Intel GPU devices between MPI ranks.

To enable this feature, set `I_MPI_OFFLOAD_TOPOLIB=10`. This feature requires that the Level-Zero\* library be installed on the nodes. The device pinning information is printed out in the Intel MPI debug output at `I_MPI_DEBUG=3`.

Default settings:

`I_MPI_OFFLOAD_CELL=tile`

`I_MPI_OFFLOAD_DOMAIN_SIZE=-1`

`I_MPI_OFFLOAD_DEVICES=all`

By default, all available resources are distributed between MPI ranks as equally as possible given the position of the ranks; that is, the distribution of resources takes into account on which NUMA node the rank and the resource are located. Ideally, the rank will have resources only on the same NUMA node on which the rank is located.

### Examples:

All examples below represent a machine configuration with two NUMA nodes and two GPUs with two tiles.

Figure 1. Four MPI Ranks

Debug output `I_MPI_DEBUG=3`:

```
[0] MPI startup(): ===== GPU pinning on host1 =====
[0] MPI startup(): Rank Pin tile
[0] MPI startup(): 0          {0}
[0] MPI startup(): 1          {1}
[0] MPI startup(): 2          {2}
[0] MPI startup(): 3          {3}
```

Figure 2. Three MPI Ranks

Debug output `I_MPI_DEBUG=3`:

```
[0] MPI startup(): ===== GPU pinning on host1 =====
[0] MPI startup(): Rank Pin tile
[0] MPI startup(): 0          {0}
[0] MPI startup(): 1          {1}
[0] MPI startup(): 2          {2,3}
```

## **`I_MPI_OFFLOAD_TOPOLIB`**

Set the interface for GPU topology recognition.

### **Syntax**

`I_MPI_OFFLOAD_TOPOLIB=<arg>`

### **Arguments**

`<arg>` String parameter.

10 Use Level-Zero library for GPU topology recognition.

---

## Description

Set this environment variable to define the interface for GPU topology recognition. Setting this variable enables the GPU Pinning feature.

## I\_MPI\_OFFLOAD\_LEVEL\_ZERO\_LIBRARY

Specify the name and full path to the Level-Zero library.

## Syntax

`I_MPI_OFFLOAD_LEVEL_ZERO_LIBRARY="<path>/<name>"`

## Arguments

`<path>` Full path to the Level-Zero library.

`<name>` Name of the Level-Zero library.

## Description

Set this environment variable to specify the name and full path to Level-Zero library. Set this variable if Level-Zero is not located in the default path. Default value: `libze_loader.so`.

## I\_MPI\_OFFLOAD\_CELL

Set this variable to define the base unit: tile (subdevice) or device (gpu).

## Syntax

`I_MPI_OFFLOAD_CELL=<cell>`

## Arguments

`<cell>` Specify the base unit.

`tile` One tile (subdevice). Default value.

`device` Whole device (gpu) with all subdevices

## Description

Set this variable to define the base unit. This variable may affect other GPU pinning variables.

## Example

Figure 3. Four MPI ranks, `I_MPI_OFFLOAD_CELL=device`

## I\_MPI\_OFFLOAD\_DOMAIN\_SIZE

Control the number of base units per MPI rank.

## Syntax

`I_MPI_OFFLOAD_DOMAIN_SIZE=<value>`

## Arguments

`<value>` Integer number.

-1 Auto. Default value. Each MPI rank may have a different domain size to use all available resources.

> 0 Custom domain size.

## Description

Set this variable to define how many base units will be pinned to the MPI rank. `I_MPI_OFFLOAD_CELL` variable defines the base unit: tile or device.

## Examples

Figure 4. Three MPI ranks, `I_MPI_OFFLOAD_DOMAIN_SIZE=1`

## `I_MPI_OFFLOAD_DEVICES`

Define a list of available devices.

## Syntax

`I_MPI_OFFLOAD_DEVICES=<devicelist>`

## Arguments

`<devicelist>` A comma-separated list of available devices.

`all` All devices are available. Default value.

`</>` Device with logical number `<l>`.

`</>-<m>` Range of devices with logical numbers from `</>` to `<m>`.

`<k>,</>-<m>` Device `<k>` and devices from `</>` to `<m>`.

## Description

Set this variable to define the available devices. This variable also gives you the ability to exclude devices.

## Example

Figure 5. Four MPI ranks, `I_MPI_OFFLOAD_DEVICES=0`

## I\_MPI\_OFFLOAD\_DEVICE\_LIST

Define a list of base units to pin for each MPI rank.

### Syntax

`I_MPI_OFFLOAD_DEVICE_LIST=<base_units_list>`

### Arguments

**<base\_units\_list>** A comma-separated list of base units. The process with the *i*-th rank is pinned to the *i*-th base unit in the list.

**<l>** Base unit with logical number **<l>**.

**<l>-<m>** Range of base units with logical numbers from **<l>** to **<m>**.

**<k>,<l>-<m>** Base unit **<k>** and base units from **<l>** to **<m>**.

### Description

Set this variable to define the list of base units to pin for each MPI rank. The process with the *i*-th rank is pinned to the *i*-th base unit in the list.

`I_MPI_OFFLOAD_CELL` variable defines the base unit: tile or device.

`I_MPI_OFFLOAD_DEVICE_LIST` variable has less priority than the `I_MPI_OFFLOAD_DOMAIN` variable.

### Example

Figure 6. Four MPI ranks, `I_MPI_OFFLOAD_DEVICE_LIST=3,2,0,1`

## I\_MPI\_OFFLOAD\_DOMAIN

Define domains through the comma separated list of hexadecimal numbers for each MPI rank

### Syntax

`I_MPI_OFFLOAD_DOMAIN=<masklist>`

## Arguments

`<masklist>` A comma-separated list of hexadecimal numbers.

`[m1, ..., mn ]` For `<masklist>`, each `mi` is a hexadecimal bit mask defining an individual domain.

The following rule is used: the *i*-th base unit is included into the domain if the corresponding bit in `mi` value is set to 1.

## Description

Set this variable to define the list of hexadecimal bit masks. For the *i*-th bit mask, if the *j*-th bit set to 1, then the *j*-th base unit will be pinned to the *i*-th MPI rank.

`I_MPI_OFFLOAD_CELL` variable defines the base unit: tile or device.

`I_MPI_OFFLOAD_DOMAIN` variable has higher priority than the `I_MPI_OFFLOAD_DEVICE_LIST`.

## Example

Figure 7. Four MPI ranks, `I_MPI_OFFLOAD_DOMAIN=[B,2,5,C]`. Parsed bit masks: `[1101,0100,1010,0011]`

# Environment Variables for Fabrics Control

This section provides description of the general environment variables for controlling fabrics, as well as description of variables for controlling specific fabrics:

- [Communication Fabrics Control](#)
- [Shared Memory Control](#)
- [OFI\\*-capable network fabrics](#)

## Communication Fabrics Control

### I\_MPI\_FABRICS

Select the particular fabrics to be used.

### Syntax

`I_MPI_FABRICS=ofi | shm:ofi | shm`

### Arguments

<code>&lt;fabric&gt;</code>	Define a network fabric.
<code>shm</code>	Shared memory transport (used for intra-node communication only).
<code>ofi</code>	OpenFabrics Interfaces* (OFI)-capable network fabrics, such as Intel® True Scale Fabric, Intel® Omni-Path Architecture, InfiniBand*, and Ethernet (through OFI API).

---

## Description

Set this environment variable to select a specific fabric combination.

The default values are `shm:ofi` for the regular mode and `ofi` for the multiple endpoints mode. In the multiple endpoints mode, the default value `ofi` cannot be changed.

---

### NOTE

This option is not applicable to `slurm` and `pdsh` bootstrap servers.

---

---

### NOTE

DAPL, TMI, and OFA fabrics are deprecated.

---

## Shared Memory Control

### I\_MPI\_SHM

Select a shared memory transport to be used.

### Syntax

`I_MPI_SHM=<transport>`

### Arguments

`<transport>`

`disable | no | off | 0`

`auto`

`bdw_sse`

`bdw_avx2`

`skx_sse`

`skx_avx2`

`skx_avx512`

`knl_ddr`

Define a shared memory transport solution.

Do not use shared memory transport.

Select a shared memory transport solution automatically.

The shared memory transport solution tuned for Intel® microarchitecture code name Broadwell. The SSE4.2 instruction set is used.

The shared memory transport solution tuned for Intel® microarchitecture code name Broadwell. The AVX2 instruction set is used.

The shared memory transport solution tuned for Intel® Xeon® processors based on Intel® microarchitecture code name Skylake. The CLFLUSHOPT and SSE4.2 instruction set is used.

The shared memory transport solution tuned for Intel® Xeon® processors based on Intel® microarchitecture code name Skylake. The CLFLUSHOPT and AVX2 instruction set is used.

The shared memory transport solution tuned for Intel® Xeon® processors based on Intel® microarchitecture code name Skylake. The CLFLUSHOPT and AVX512 instruction set is used.

The shared memory transport solution tuned for Intel® microarchitecture code name Knights Landing.

<code>kn1_mcdram</code>	The shared memory transport solution tuned for Intel® microarchitecture code name Knights Landing. Shared memory buffers may be partially located in the Multi-Channel DRAM (MCDRAM).
<code>clx_sse</code>	The shared memory transport solution tuned for Intel® Xeon® processors based on Intel® microarchitecture code name Cascade Lake. The CLFLUSHOPT and SSE4.2 instruction set is used.
<code>clx_avx2</code>	The shared memory transport solution tuned for Intel® Xeon® processors based on Intel® microarchitecture code name Cascade Lake. The CLFLUSHOPT and AVX2 instruction set is used.
<code>clx_avx512</code>	The shared memory transport solution tuned for Intel® Xeon® processors based on Intel® microarchitecture code name Cascade Lake. The CLFLUSHOPT and AVX512 instruction set is used.
<code>clx-ap</code>	The shared memory transport solution tuned for Intel® Xeon® processors based on Intel® microarchitecture code name Cascade Lake Advanced Performance.

## Description

Set this environment variable to select a specific shared memory transport solution.

Automatically selected transports:

- `bdw_avx2` for Intel® microarchitecture code name Haswell, Broadwell and Skylake
- `skx_avx2` for Intel® Xeon® processors based on Intel® microarchitecture code name Skylake
- `ckx_avx2` for Intel® Xeon® processors based on Intel® microarchitecture code name Cascade Lake
- `kn1_mcdram` for Intel® microarchitecture code name Knights Landing and Knights Mill
- `bdw_sse` for all other platforms

The value of `I_MPI_SHM` depends on the value of `I_MPI_FABRICS` as follows: if `I_MPI_FABRICS` is `ofi`, `I_MPI_SHM` is disabled. If `I_MPI_FABRICS` is `shm:ofi`, `I_MPI_SHM` defaults to `auto` or takes the specified value.

`I_MPI_SHM_CELL_FWD_SIZE`

Change the size of a shared memory forward cell.

## Syntax

`I_MPI_SHM_CELL_FWD_SIZE=<nbytes>`

## Arguments

<code>&lt;nbytes&gt;</code>	The size of a shared memory forward cell in bytes
<code>&gt; 0</code>	The default <code>&lt;nbytes&gt;</code> value depends on the transport used and should normally range from 64K to 1024K.

## Description

Forward cells are in-cache message buffer cells used for sending small amounts of data. Lower values are recommended. Set this environment variable to define the size of a forward cell in the shared memory transport.

`I_MPI_SHM_CELL_BWD_SIZE`

Change the size of a shared memory backward cell.

---

## Syntax

`I_MPI_SHM_CELL_BWD_SIZE=<nbytes>`

## Arguments

<code>&lt;nbytes&gt;</code>	The size of a shared memory backward cell in bytes
<code>&gt; 0</code>	The default <code>&lt;nbytes&gt;</code> value depends on the transport used and should normally range from 64K to 1024K.

## Description

Backward cells are out-of-cache message buffer cells used for sending large amounts of data. Higher values are recommended. Set this environment variable to define the size of a backward cell in the shared memory transport.

`I_MPI_SHM_CELL_EXT_SIZE`

Change the size of a shared memory extended cell.

## Syntax

`I_MPI_SHM_CELL_EXT_SIZE=<nbytes>`

## Arguments

<code>&lt;nbytes&gt;</code>	The size of a shared memory extended cell in bytes
<code>&gt; 0</code>	The default <code>&lt;nbytes&gt;</code> value depends on the transport used and should normally range from 64K to 1024K.

## Description

Extended cells are used in the imbalanced applications when forward and backward cells are run out. An extended cell does not have a specific owner - it is shared between all ranks on the computing node. Set this environment variable to define the size of an extended cell in the shared memory transport.

`I_MPI_SHM_CELL_FWD_NUM`

Change the number of forward cells in the shared memory transport (per rank).

## Syntax

`I_MPI_SHM_CELL_FWD_NUM=<num>`

## Arguments

<code>&lt;num&gt;</code>	The number of shared memory forward cells
<code>&gt; 0</code>	The default value depends on the transport used and should normally range from 4 to 16.

## Description

Set this environment variable to define the number of forward cells in the shared memory transport.

`I_MPI_SHM_CELL_BWD_NUM`

Change the number of backward cells in the shared memory transport (per rank).

## Syntax

`I_MPI_SHM_CELL_BWD_NUM=<num>`

## Arguments

<num>	The number of shared memory backward cells
> 0	The default value depends on the transport used and should normally range from 4 to 64.

## Description

Set this environment variable to define the number of backward cells in the shared memory transport.

`I_MPI_SHM_CELL_EXT_NUM_TOTAL`

Change the total number of extended cells in the shared memory transport.

## Syntax

`I_MPI_SHM_CELL_EXT_NUM_TOTAL=<num>`

## Arguments

<num>	The number of shared memory backward cells
> 0	The default value depends on the transport used and should normally range from 2K to 8K.

## Description

Set this environment variable to define the number of extended cells in the shared memory transport.

### NOTE

This is not "per rank" number, it is total number of extended cells on the computing node.

`I_MPI_SHM_CELL_FWD_HOLD_NUM`

Change the number of hold forward cells in the shared memory transport (per rank).

## Syntax

`I_MPI_SHM_CELL_FWD_HOLD_NUM=<num>`

## Arguments

<num>	The number of shared memory hold forward cells
> 0	The default value depends on the transport used and must be less than <code>I_MPI_SHM_CELL_FWD_NUM</code> .

## Description

Set this environment variable to define the number of forward cells in the shared memory transport a rank can hold at the same time. Recommended values are powers of two in the range between 1 and 8.

`I_MPI_SHM_MCDRAM_LIMIT`

Change the size of the shared memory bound to the multi-channel DRAM (MCDRAM) (size per rank).

## Syntax

`I_MPI_SHM_MCDRAM_LIMIT=<nbytes>`

---

## Arguments

<nbytes>	The size of the shared memory bound to MCDRAM per rank
1048576	This is the default value.

## Description

Set this environment variable to define how much MCDRAM memory per rank is allowed for the shared memory transport. This variable takes effect with `I_MPI_SHM=kn1_mcdram` only.

`I_MPI_SHM_SEND_SPIN_COUNT`

Control the spin count value for the shared memory transport for sending messages.

## Syntax

`I_MPI_SHM_SEND_SPIN_COUNT=<count>`

## Arguments

<count>	Define the spin count value. A typical value range is between 1 and 1000.
---------	---

## Description

If the recipient ingress buffer is full, the sender may be blocked until this spin count value is reached. It has no effect when sending small messages.

`I_MPI_SHM_RECV_SPIN_COUNT`

Control the spin count value for the shared memory transport for receiving messages.

## Syntax

`I_MPI_SHM_RECV_SPIN_COUNT=<count>`

## Arguments

<count>	Define the spin count value. A typical value range is between 1 and 1000000.
---------	--

## Description

If the receive is non-blocking, this spin count is used only for safe reorder of expected and unexpected messages. It has no effect on receiving small messages.

`I_MPI_SHM_FILE_PREFIX_4K`

Change the mount point of the 4 KB pages size file system (`tmpfs`) where the shared memory files are created.

## Syntax

`I_MPI_SHM_FILE_PREFIX_4K=<path>`

## Arguments

<path>	Define the path to the existed mount point of the 4 KB pages size file system ( <code>tmpfs</code> ). By default, the path is not set.
--------	--

## Description

Set this environment variable to define a new path to the shared memory files. By default, the shared memory files are created at `/dev/shm/`.

This variable affects shared memory transport buffers and RMA windows.

Example

```
I_MPI_SHM_FILE_PREFIX_4K=/dev/shm/intel/
```

`I_MPI_SHM_FILE_PREFIX_2M`

Change the mount point of the 2 MB pages size file system (`hugetlbfs`) where the shared memory files are created.

## Syntax

`I_MPI_SHM_FILE_PREFIX_2M=<path>`

## Arguments

`<path>`

Define the path to the existed mount point of the 2 MB pages size file system (`hugetlbfs`). By default, the path is not set.

## Description

Set this environment variable to enable 2 MB huge pages on the Intel MPI Library.

The variable affects shared memory transport buffers. It may affect RMA windows as well if the windows size is greater than or equal to 2 MB.

Example

```
I_MPI_SHM_FILE_PREFIX_2M=/dev/hugepages
```

### NOTE

The root privileges are required to configure the huge pages subsystem. Contact your system administrator to obtain permission.

`I_MPI_SHM_FILE_PREFIX_1G`

Change the mount point of the 1 GB pages size file system (`hugetlbfs`) where the shared memory files are created.

## Syntax

`I_MPI_SHM_FILE_PREFIX_1G=<path>`

## Arguments

`<path>`

Define the path to the existed mount point of the 1 GB pages size file system (`hugetlbfs`). By default, the path is not set.

## Description

Set this environment variable to enable 1 GB huge pages on the Intel MPI Library.

---

The variable affects shared memory transport buffers. It may affect RMA windows as well if the windows size is greater than or equal to 1 GB.

Example

```
I_MPI_SHM_FILE_PREFIX_1G=/dev/hugepages1G
```

---

**NOTE**

The root privileges are required to configure the huge pages subsystem. Contact your system administrator to obtain permission.

---

## OFI\*-capable Network Fabrics Control

### I\_MPI\_OFI\_PROVIDER

Define the name of the OFI provider to load.

#### Syntax

```
I_MPI_OFI_PROVIDER=<name>
```

#### Arguments

<name>	The name of the OFI provider to load
--------	--------------------------------------

#### Description

Set this environment variable to define the name of the OFI provider to load. If you do not specify this variable, the OFI library chooses the provider automatically. You can check all available providers by using the `I_MPI_OFI_PROVIDER_DUMP` environment variable. If you set the wrong name for an available provider, use `FI_LOG_LEVEL=debug` to get a hint to set the name correctly.

### I\_MPI\_OFI\_PROVIDER\_DUMP

Control the capability of printing information about all OFI providers and their attributes from an OFI library.

#### Syntax

```
I_MPI_OFI_PROVIDER_DUMP=<arg>
```

#### Arguments

<arg>	Binary indicator
enable   yes   on   1	Print the list of all OFI providers and their attributes from an OFI library
disable   no   off   0	No action. This is the default value

#### Description

Set this environment variable to control the capability of printing information about all OFI providers and their attributes from an OFI library.

### I\_MPI\_OFI\_DRECV

Control the capability of the direct receive in the OFI fabric.

## Syntax

`I_MPI_OFI_DRECV=<arg>`

## Arguments

<code>&lt;arg&gt;</code>	Binary indicator
<code>enable   yes   on   1</code>	Enable direct receive. This is the default value
<code>disable   no   off   0</code>	Disable direct receive

## Description

Use the direct receive capability to block `MPI_Recv` calls only. Before using the direct receive capability, ensure that you use it for single-threaded MPI applications and check if you have selected OFI as the network fabric by setting `I_MPI_FABRICS=ofi`.

## I\_MPI\_OFI\_LIBRARY\_INTERNAL

Control the usage of libfabric\* shipped with the Intel® MPI Library.

## Syntax

`I_MPI_OFI_LIBRARY_INTERNAL=<arg>`

## Arguments

<code>&lt;arg&gt;</code>	Binary indicator
<code>enable   yes   on   1</code>	Use libfabric from the Intel MPI Library
<code>disable   no   off   0</code>	Do not use libfabric from the Intel MPI Library

## Description

Set this environment variable to disable or enable usage of libfabric from the Intel MPI Library. The variable must be set before sourcing the `vars.[c]sh` script.

## Example

```
$ export I_MPI_OFI_LIBRARY_INTERNAL=1
$ source <installdir> /bin/vars.sh
```

Setting this variable is equivalent to passing the `-ofi_internal` option to the `vars.[c]sh` script.

For more information, refer to the Intel® MPI Library Developer Guide, section *Running Applications > Libfabric\* Support*.

# Environment Variables for Memory Policy Control

Intel® MPI Library supports non-uniform memory access (NUMA) nodes with high-bandwidth (HBW) memory (MCDRAM) on Intel® Xeon Phi™ processors (codenamed Knights Landing). Intel® MPI Library can attach memory of MPI processes to the memory of specific NUMA nodes. This section describes the environment variables for such memory placement control.

`I_MPI_HBW_POLICY`

Set the policy for MPI process memory placement for using HBW memory.

## Syntax

`I_MPI_HBW_POLICY=<user memory policy>[,<mpi memory policy>][,<win_allocate policy>]`

---

In the syntax:

- `<user memory policy>` - memory policy used to allocate the memory for user applications (required)
- `<mpi memory policy>` - memory policy used to allocate the internal MPI memory (optional)
- `<win_allocate policy>` - memory policy used to allocate memory for window segments for RMA operations (optional)

Each of the listed policies may have the values below:

## Arguments

<code>&lt;value&gt;</code>	The memory allocation policy used.
<code>hbw_preferred</code>	Allocate the local HBW memory for each process. If the HBW memory is not available, allocate the local dynamic random access memory.
<code>hbw_bind</code>	Allocate only the local HBW memory for each process.
<code>hbw_interleave</code>	Allocate the HBW memory and dynamic random access memory on the local node in the round-robin manner.

## Description

Use this environment variable to specify the policy for MPI process memory placement on a machine with HBW memory.

By default, Intel MPI Library allocates memory for a process in local DDR. The use of HBW memory becomes available only when you specify the `I_MPI_HBW_POLICY` variable.

## Examples

The following examples demonstrate different configurations of memory placement:

- `I_MPI_HBW_POLICY=hbw_bind,hbw_preferred,hbw_bind`  
Only use the local HBW memory allocated in user applications and window segments for RMA operations. Use the local HBW memory internally allocated in Intel® MPI Library first. If the HBW memory is not available, use the local DDR internally allocated in Intel MPI Library.
- `I_MPI_HBW_POLICY=hbw_bind,,hbw_bind`  
Only use the local HBW memory allocated in user applications and window segments for RMA operations. Use the local DDR internally allocated in Intel MPI Library.
- `I_MPI_HBW_POLICY=hbw_bind,hbw_preferred`  
Only use the local HBW memory allocated in user applications. Use the local HBW memory internally allocated in Intel MPI Library first. If the HBW memory is not available, use the local DDR internally allocated in Intel MPI Library. Use the local DDR allocated in window segments for RMA operations.

`I_MPI_BIND_NUMA`

Set the NUMA nodes for memory allocation.

## Syntax

`I_MPI_BIND_NUMA=<value>`

## Arguments

<code>&lt;value&gt;</code>	Specify the NUMA nodes for memory allocation.
<code>localalloc</code>	Allocate memory on the local node. This is the default value.

Node\_1,...,Node\_k

Allocate memory according to I\_MPI\_BIND\_ORDER on the specified NUMA nodes.

## Description

Set this environment variable to specify the NUMA node set that is involved in the memory allocation procedure.

**I\_MPI\_BIND\_ORDER**

Set this environment variable to define the memory allocation manner.

## Syntax

**I\_MPI\_BIND\_ORDER**=<value>

## Arguments

<value>	Specify the allocation manner.
compact	Allocate memory for processes as close as possible (in terms of NUMA nodes), among the NUMA nodes specified in I_MPI_BIND_NUMA. This is the default value.
scatter	Allocate memory among the NUMA nodes specified in I_MPI_BIND_NUMA using the round-robin manner.

## Description

Set this environment variable to define the memory allocation manner among the NUMA nodes specified in I\_MPI\_BIND\_NUMA. The variable has no effect without I\_MPI\_BIND\_NUMA set.

**I\_MPI\_BIND\_WIN\_ALLOCATE**

Set this environment variable to control memory allocation for window segments.

## Syntax

**I\_MPI\_BIND\_WIN\_ALLOCATE**=<value>

## Arguments

<value>	Specify the memory allocation behavior for window segments.
localalloc	Allocate memory on the local node. This is the default value.
hbw_preferred	Allocate the local HBW memory for each process. If the HBW memory is not available, allocate the local dynamic random access memory.
hbw_bind	Allocate only the local HBW memory for each process.
hbw_interleave	Allocate the HBW memory and dynamic random access memory on a local node in the round-robin manner.
<NUMA node id>	Allocate memory on the given NUMA node.

## Description

Set this environment variable to create window segments allocated in HBW memory with the help of the MPI\_Win\_allocate\_shared or MPI\_Win\_allocate functions.

**MPI\_Info**

---

You can control memory allocation for window segments with the help of an `MPI_Info` object, which is passed as a parameter to the `MPI_Win_allocate` or `MPI_Win_allocate_shared` function. In an application, if you specify such an object with the `numa_bind_policy` key, window segments are allocated in accordance with the value for `numa_bind_policy`. Possible values are the same as for `I_MPI_BIND_WIN_ALLOCATE`.

A code fragment demonstrating the use of `MPI_Info`:

```
MPI_Info info;
...
MPI_Info_create( &info );
MPI_Info_set( info, "numa_bind_policy", "hbw_preferred" );
...
MPI_Win_allocate_shared( size, disp_unit, info, comm, &baseptr, &win );
```

---

#### NOTE

When you specify the memory placement policy for window segments, Intel MPI Library recognizes the configurations according to the following priority:

---

1. Setting of `MPI_Info`.
2. Setting of `I_MPI_HBW_POLICY`, if you specified `<win_allocate policy>`.
3. Setting of `I_MPI_BIND_WIN_ALLOCATE`.

## Environment Variables for Asynchronous Progress Control

---

---

#### NOTE

This feature is supported for the `release_mt` and `debug_mt` library configurations only. To specify the configuration, run the following command:

```
$ source <installdir>/bin/vars.sh release_mt
```

---

### `I_MPI_ASYNC_PROGRESS`

Control the usage of progress threads.

#### Syntax

`I_MPI_ASYNC_PROGRESS=<arg>`

#### Arguments

<code>&lt;arg&gt;</code>	Binary indicator
<code>disable   no   off   0</code>	Disable asynchronous progress threads for each rank. This is the default value.
<code>enable   yes   on   1</code>	Enable asynchronous progress threads.

#### Description

Set this environment variable to enable asynchronous progress. If disabled, the `I_MPI_ASYNC_PROGRESS_*` knobs are ignored.

### `I_MPI_ASYNC_PROGRESS_THREADS`

Control the number of asynchronous progress threads.

## Syntax

`I_MPI_ASYNC_PROGRESS_THREADS=<arg>`

## Arguments

<code>&lt;nthreads&gt;</code>	Define the number of progress threads. The default value is 1.
-------------------------------	--

## Description

Set this environment variable to control the number of asynchronous progress threads for each rank.

## `I_MPI_ASYNC_PROGRESS_PIN`

Control the asynchronous progress threads pinning.

## Syntax

`I_MPI_ASYNC_PROGRESS_PIN=<arg>`

## Arguments

<code>&lt;arg&gt;</code>	Comma-separated list of logical processors
<code>&lt;CPU list&gt;</code>	Pin all progress threads of local processes to the listed CPUs. By default, N progress threads are pinned to the last N logical processors.

## Description

Set this environment variable to control pinning for all progress threads of local processes.

Example

```
I_MPI_ASYNC_PROGRESS_THREADS=2
I_MPI_ASYNC_PROGRESS_PIN="0,1,2,3,4,5"
```

In case of three MPI processes per node, progress threads of the first process are pinned to 0, 1, second are pinned to 2, 3, and third are pinned to 4, 5.

## `I_MPI_ASYNC_PROGRESS_ID_KEY`

Set the MPI info object key that is used to explicitly define the progress thread id for a communicator.

## Syntax

`I_MPI_ASYNC_PROGRESS_ID_KEY=<arg>`

## Arguments

<code>&lt;key&gt;</code>	MPI info object key. The default value is <code>thread_id</code> .
--------------------------	--

## Description

Set this environment variable to control the MPI info object key that is used to define the progress thread id for a communicator. The progress thread id is used for work distribution between progress threads. By default, communication goes over the first progress thread.

---

**NOTE**

Exclude selected processors for progress threads from pinning of computational threads to avoid oversubscription of cores.

For more information and examples, refer to the Intel® MPI Library Developer Guide, section *Additional Supported Features > Asynchronous Progress Control*.

---

## Environment Variables for Multi-EP

---

Intel® MPI Library Developer Guide for Windows\*Linux\* OS

---

**NOTE**

This feature is supported for the `release_mt` and `debug_mt` library configurations only. To specify the configuration, run the following command:

```
$ source <installdir>/bin/vars.sh release_mt
```

---

### PI\_THREAD\_SPLIT

#### Syntax

`I_MPI_THREAD_SPLIT=<value>`

#### Arguments

<code>&lt;value&gt;</code>	Binary indicator
0   no   off   disable	Disable the MPI_THREAD_SPLIT model support. This is the default value
1   yes   on   enable	Enable the MPI_THREAD_SPLIT model support

#### Description

Use this environment variable to control the `I_MPI_THREAD_SPLIT` programming model.

### I\_MPI\_THREAD\_RUNTIME

#### Syntax

`I_MPI_THREAD_RUNTIME=<value>`

#### Arguments

<code>&lt;value&gt;</code>	Thread runtime
generic	Enable runtime support (for example, pthreads, TBB). This is the default value if OpenMP* cannot be detected at runtime
openmp	Enable OpenMP* runtime support. This is the default value if OpenMP is detected at runtime.

#### Description

Use this environment variable to control threading runtime support.

**NOTE**

`I_MPI_THREAD_SPLIT` model support is enabled.

## **I\_MPI\_THREAD\_MAX**

### **Syntax**

`I_MPI_THREAD_MAX=<int>`

### **Arguments**

`<int>`

The maximum number of threads per rank. The default value is `omp_get_max_threads()` if `I_MPI_THREAD_RUNTIME` is set to `openmp`, 1 otherwise

### **Description**

Use this environment variable to set the maximum number of threads to be used in each process concurrently.

## **I\_MPI\_THREAD\_ID\_KEY**

### **Syntax**

`I_MPI_THREAD_ID_KEY=<string>`

### **Arguments**

`<string>`

Define the MPI info object key. The default value is `thread_id`

### **Description**

Use this environment variable to set the MPI info object key that is used to explicitly define the logical thread number `thread_id`.

## **Other Environment Variables**

### **I\_MPI\_DEBUG**

Print out debugging information when an MPI program starts running.

### **Syntax**

`I_MPI_DEBUG=<level>[,<flags>]`

### **Arguments**

`<level>`

0

1, 2

Indicate the level of debug information provided

Output no debugging information. This is the default value.

Output libfabric\* version and provider.

3	Output effective MPI rank, pid and node mapping table.
4	Output process pinning information.
5	Output environment variables specific to Intel® MPI Library.
> 5	Add extra levels of debug information.

<flags>	Comma-separated list of debug flags
pid	Show process id for each debug message.
tid	Show thread id for each debug message for multithreaded library.
time	Show time for each debug message.
datetime	Show time and date for each debug message.
host	Show host name for each debug message.
level	Show level for each debug message.
scope	Show scope for each debug message.
line	Show source line number for each debug message.
file	Show source file name for each debug message.
nofunc	Do not show routine name.
norank	Do not show rank.
flock	Synchronize debug output from different process or threads.
nobuf	Do not use buffered I/O for debug output.

## Description

Set this environment variable to print debugging information about the application.

### NOTE

Set the same <level> value for all ranks.

You can specify the output file name for debug information by setting the `I_MPI_DEBUG_OUTPUT` environment variable.

Each printed line has the following format:

```
[<identifier>] <message>
```

where:

- <identifier> is the MPI process rank, by default. If you add the '+' sign in front of the <level> number, the <identifier> assumes the following format: rank#pid@hostname. Here, rank is the MPI process rank, pid is the UNIX\* process ID, and hostname is the host name. If you add the '-' sign, <identifier> is not printed at all.
- <message> contains the debugging output.

The following examples demonstrate possible command lines with the corresponding output:

```
$ mpirun -n 1 -env I_MPI_DEBUG=2 ./a.out
...
[0] MPI startup(): shared memory data transfer mode
```

The following commands are equal and produce the same output:

```
$ mpirun -n 1 -env I_MPI_DEBUG=2,pid,host ./a.out
...
[0#1986@mpiclust001] MPI startup(): shared memory data transfer mode

> mpiexec -n 1 -env I_MPI_DEBUG=2,pid,host test.exe
...
[0#1986@mpiclust001] MPI startup(): shared memory data transfer mode
```

## Note

Compiling with the `-g` option adds a considerable amount of printed debug information.

## I\_MPI\_DEBUG\_OUTPUT

Set output file name for debug information.

### Syntax

`I_MPI_DEBUG_OUTPUT=<arg>`

### Arguments

<code>&lt;arg&gt;</code>	String value
<code>stdout</code>	Output to <code>stdout</code> . This is the default value.
<code>stderr</code>	Output to <code>stderr</code> .
<code>&lt;file_name&gt;</code>	Specify the output file name for debug information (the maximum file name length is 256 symbols).

### Description

Set this environment variable if you want to split output of debug information from the output produced by an application. If you use format like `%r`, `%p` or `%h`, rank, process ID or host name is added to the file name accordingly.

## I\_MPI\_DEBUG\_COREDUMP

Controls core dump files generation in case of failure during MPI application execution.

### Syntax

`I_MPI_DEBUG_COREDUMP=<arg>`

### Arguments

<code>&lt;arg&gt;</code>	Binary indicator
<code>enable yes on 1</code>	Enable coredump files generation.
<code>disable no off 0</code>	Do not generate coredump files. Default value.

### Description

Set this environment variable to enable coredump files dumping in case of termination caused by segmentation fault. Available for both release and debug builds.

## I\_MPI\_STATS

Collect MPI statistics from your application using Application Performance Snapshot.

---

## Syntax

`I_MPI_STATS=<level>`

## Arguments

<code>&lt;level&gt;</code>	Indicate the level of statistics collected
<code>1,2,3,4,5</code>	Specify the level to indicate amount of MPI statistics to be collected by Application Performance Snapshot (APS).
	The full description of levels is available in the official APS <a href="#">documentation</a> .

## Description

Set this variable to collect MPI-related statistics from your MPI application using Application Performance Snapshot. The variable creates a new folder `aps_result_<date>-<time>` containing statistics data. To analyze the collected data, use the `aps` utility. For example:

```
$ export I_MPI_STATS=5
$ mpirun -n 2 ./myApp
$ aps-report aps_result_20171231_235959
```

## I\_MPI\_STARTUP\_MODE

Select a mode for the Intel® MPI Library process startup algorithm.

## Syntax

`I_MPI_STARTUP_MODE=<arg>`

## Arguments

<code>&lt;arg&gt;</code>	String value
<code>pmi_shm</code>	Use shared memory to reduce the number of PMI calls. This mode is enabled by default.
<code>pmi_shm_netmod</code>	Use the <code>netmod</code> infrastructure for address exchange logic in addition to PMI and shared memory.

## Description

The `pmi_shm` and `pmi_shm_netmod` modes reduce the application startup time. The efficiency of the modes is more clearly observed with the higher `-ppn` value, while there is no improvement at all with `-ppn 1`.

## I\_MPI\_PMI\_LIBRARY

Specify the name to third party implementation of the PMI library.

## Syntax

`I_MPI_PMI_LIBRARY=<name>`

## Arguments

<code>&lt;name&gt;</code>	Full name of the third party PMI library
---------------------------	--

## Description

Set `I_MPI_PMI_LIBRARY` to specify the name of third party PMI library. When you set this environment variable, provide full name of the library with full path to it.

Currently supported PMI versions: PMI1, PMI2

## I\_MPI\_PMI\_VALUE\_LENGTH\_MAX

Control the length of the value buffer in PMI on the client side.

## Syntax

`I_MPI_PMI_VALUE_LENGTH_MAX=<length>`

## Arguments

<code>&lt;length&gt;</code>	Define the value of the buffer length in bytes.
<code>&lt;n&gt; &gt; 0</code>	The default value is -1, which means do not override the value received from the <code>PMI_KVS_Get_value_length_max()</code> function.

## Description

Set this environment variable to control the length of the value buffer in PMI on the client side. The length of the buffer will be the lesser of `I_MPI_PMI_VALUE_LENGTH_MAX` and `PMI_KVS_Get_value_length_max()`.

## I\_MPI\_OUTPUT\_CHUNK\_SIZE

Set the size of the `stdout/stderr` output buffer.

## Syntax

`I_MPI_OUTPUT_CHUNK_SIZE=<size>`

## Arguments

<code>&lt;size&gt;</code>	Define output chunk size in kilobytes
<code>&lt;n&gt; &gt; 0</code>	The default chunk size value is 1 KB

## Description

Set this environment variable to increase the size of the buffer used to intercept the standard output and standard error streams from the processes. If the `<size>` value is not greater than zero, the environment variable setting is ignored and a warning message is displayed.

Use this setting for applications that create a significant amount of output from different processes. With the `-ordered-output` option of `mpiexec.hydra`, this setting helps to prevent the output from garbling.

### NOTE

Set the `I_MPI_OUTPUT_CHUNK_SIZE` environment variable in the shell environment before executing the `mpiexec.hydra/mpiexec` command. Do not use the `-genv` or `-env` options for setting the `<size>` value. Those options are used only for passing environment variables to the MPI process environment.

---

## I\_MPI\_REMOVED\_VAR\_WARNING

Print out a warning if a removed environment variable is set.

### Syntax

I\_MPI\_REMOVED\_VAR\_WARNING=<arg>

### Arguments

<arg>	Binary indicator
enable   yes   on   1	Print out the warning. This is the default value
disable   no   off   0	Do not print the warning

### Description

Use this environment variable to print out a warning if a removed environment variable is set. Warnings are printed regardless of whether I\_MPI\_DEBUG is set.

## I\_MPI\_VAR\_CHECK\_SPELLING

Print out a warning if an unknown environment variable is set.

### Syntax

I\_MPI\_VAR\_CHECK\_SPELLING=<arg>

### Arguments

<arg>	Binary indicator
enable   yes   on   1	Print out the warning. This is the default value
disable   no   off   0	Do not print the warning

### Description

Use this environment variable to print out a warning if an unsupported environment variable is set. Warnings are printed in case of removed or misprinted environment variables.

## I\_MPI\_LIBRARY\_KIND

Specify the Intel® MPI Library configuration.

### Syntax

I\_MPI\_LIBRARY\_KIND=<value>

### Arguments

<value>	Binary indicator
release	Multi-threaded optimized library (with the global lock). This is the default value
debug	Multi-threaded debug library (with the global lock)
release_mt	Multi-threaded optimized library (with per-object lock for the thread-split model)
debug_mt	Multi-threaded debug library (with per-object lock for the thread-split model)

## Description

Use this variable to set an argument for the `vars.[c]sh` script. This script establishes the Intel® MPI Library environment and enables you to specify the appropriate library configuration. To ensure that the desired configuration is set, check the `LD_LIBRARY_PATH` variable.

## Example

```
$ export I_MPI_LIBRARY_KIND=debug
```

Setting this variable is equivalent to passing an argument directly to the `vars.[c]sh` script:

## Example

```
$ . <installdir>/bin/vars.sh release
```

## I\_MPI\_PLATFORM

Select the intended optimization platform.

## Syntax

`I_MPI_PLATFORM=<platform>`

## Arguments

<code>&lt;platform&gt;</code>	Intended optimization platform (string value)
<code>auto</code>	Use only with heterogeneous runs to determine the appropriate platform across all nodes. May slow down MPI initialization time due to collective operation across all nodes.
<code>ivb</code>	Optimize for the Intel® Xeon® Processors E3, E5, and E7 V2 series and other Intel® Architecture processors formerly code named Ivy Bridge.
<code>hsw</code>	Optimize for the Intel Xeon Processors E3, E5, and E7 V3 series and other Intel® Architecture processors formerly code named Haswell.
<code>bdw</code>	Optimize for the Intel Xeon Processors E3, E5, and E7 V4 series and other Intel Architecture processors formerly code named Broadwell.
<code>knl</code>	Optimize for the Intel® Xeon Phi™ processor and coprocessor formerly code named Knights Landing.
<code>skx</code>	Optimize for the Intel Xeon Processors E3 V5 and Intel Xeon Scalable Family series, and other Intel Architecture processors formerly code named Skylake.
<code>clx</code>	Optimize for the 2nd Generation Intel Xeon Scalable Processors, and other Intel® Architecture processors formerly code named Cascade Lake.
<code>clx-ap</code>	Optimize for the 2nd Generation Intel Xeon Scalable Processors, and other Intel Architecture processors formerly code named Cascade Lake AP Note: The explicit <code>clx-ap</code> setting is ignored if the actual platform is not Intel.

---

## Description

Set this environment variable to use the predefined platform settings. The default value is a local platform for each node.

The variable is available for both Intel and non-Intel microprocessors, but it may utilize additional optimizations for Intel microprocessors than it utilizes for non-Intel microprocessors.

---

### NOTE

The values `auto[:min]`, `auto:max`, and `auto:most` may increase the MPI job startup time.

---

## I\_MPI\_MALLOC

Control the Intel® MPI Library custom allocator of private memory.

### Syntax

`I_MPI_MALLOC=<arg>`

### Argument

<code>&lt;arg&gt;</code>	Binary indicator
1	Enable the Intel MPI Library custom allocator of private memory.  Use the Intel MPI custom allocator of private memory for <code>MPI_Alloc_mem/MPI_Free_mem</code> .
0	Disable the Intel MPI Library custom allocator of private memory.  Use the system-provided memory allocator for <code>MPI_Alloc_mem/MPI_Free_mem</code> .

## Description

Use this environment variable to enable or disable the Intel MPI Library custom allocator of private memory for `MPI_Alloc_mem/MPI_Free_mem`.

By default, `I_MPI_MALLOC` is enabled for `release` and `debug` Intel MPI library configurations and disabled for `release_mt` and `debug_mt` configurations.

---

### NOTE

If the platform is not supported by the Intel MPI Library custom allocator of private memory, a system-provided memory allocator is used and the `I_MPI_MALLOC` variable is ignored.

---

## I\_MPI\_SHM\_HEAP

Control the Intel® MPI Library custom allocator of shared memory.

### Syntax

`I_MPI_SHM_HEAP=<arg>`

## Argument

<arg>	Binary indicator
1	Use the Intel MPI custom allocator of shared memory for MPI_Alloc_mem/MPI_Free_mem.
0	Do not use the Intel MPI custom allocator of shared memory for MPI_Alloc_mem/MPI_Free_mem.

## Description

Use this environment variable to enable or disable the Intel MPI Library custom allocator of shared memory for MPI\_Alloc\_mem/MPI\_Free\_mem.

By default, I\_MPI\_SHM\_HEAP is disabled. If enabled, it can improve performance of the shared memory transport because in that case it is possible to make only one memory copy operation instead of two copy-in/copy-out memory copy operations. If both I\_MPI\_SHM\_HEAP and I\_MPI\_MALLOC are enabled, the shared memory allocator is used first. The private memory allocator is used only when required volume of shared memory is not available.

## Details

By default, the shared memory segment is allocated on tmpfs file system on the /dev/shm/ mount point. Starting from Linux kernel 4.7, it is possible to enable transparent huge pages on the shared memory. If Intel MPI Library shared memory heap is used, it is recommended to enable transparent huge pages on your system. To enable transparent huge pages on /dev/shm, please contact your system administrator or execute the following command:

```
sudo mount -o remount,huge=advise /dev/shm
```

In order to use another tmpfs mount point instead of /dev/shm/, use I\_MPI\_SHM\_FILE\_PREFIX\_4K, I\_MPI\_SHM\_FILE\_PREFIX\_2M, and I\_MPI\_SHM\_FILE\_PREFIX\_1G.

### NOTE

If your application does not use MPI\_Alloc\_mem/MPI\_Free\_mem directly, you can override standard malloc/calloc/realloc/free procedures by preloading the libmpi\_shm\_heap\_proxy.so library:

```
export LD_PRELOAD=$I_MPI_ROOT/lib/libmpi_shm_heap_proxy.so
export I_MPI_SHM_HEAP=1
```

In this case, the malloc/calloc/realloc is a proxy for MPI\_Alloc\_mem and free is a proxy for MPI\_Free\_mem.

### NOTE

If the platform is not supported by the Intel MPI Library custom allocator of shared memory, the I\_MPI\_SHM\_HEAP variable is ignored.

## I\_MPI\_SHM\_HEAP\_VSIZE

Change the size (per rank) of virtual shared memory available for the Intel MPI Library custom allocator of shared memory.

## Syntax

```
I_MPI_SHM_HEAP_VSIZE=<size>
```

## Argument

<code>&lt;size&gt;</code>	The size (per rank) of shared memory used in shared memory heap (in megabytes).
<code>&gt;0</code>	If shared memory heap is enabled for <code>MPI_Alloc_mem/</code> <code>MPI_Free_mem</code> , the default value is 4096.

## Description

Intel MPI Library custom allocator of shared memory works with fixed size virtual shared memory. The shared memory segment is allocated on `MPI_Init` and cannot be enlarged later.

The `I_MPI_SHM_HEAP_VSIZE=0` completely disables the Intel MPI Library shared memory allocator.

## I\_MPI\_SHM\_HEAP\_CSIZE

Change the size (per rank) of shared memory cached in the Intel MPI Library custom allocator of shared memory.

## Syntax

`I_MPI_SHM_HEAP_CSIZE=<size>`

## Argument

<code>&lt;size&gt;</code>	The size (per rank) of shared memory used in Intel MPI Library shared memory allocator (in megabytes).
<code>&gt;0</code>	It depends on the available shared memory size and number of ranks. Normally, the size is less than 256.

## Description

Small values of `I_MPI_SHM_HEAP_CSIZE` may reduce overall shared memory consumption. Larger values of this variable may speed up `MPI_Alloc_mem/MPI_Free_mem`.

## I\_MPI\_SHM\_HEAP\_OPT

Change the optimization mode of Intel MPI Library custom allocator of shared memory.

## Syntax

`I_MPI_SHM_HEAP_OPT=<mode>`

## Argument

<code>&lt;mode&gt;</code>	Optimization mode
<code>rank</code>	In this mode, each rank has its own dedicated amount of shared memory. This is the default value when <code>I_MPI_SHM_HEAP=1</code>
<code>numa</code>	In this mode, all ranks from NUMA-node use the same amount of shared memory.

## Description

It is recommended to use `I_MPI_SHM_HEAP_OPT=rank` when each rank uses the same amount of memory, and `I_MPI_SHM_HEAP_OPT=numa` when ranks use significantly different amounts of memory.

Usually, the `I_MPI_SHM_HEAP_OPT=rank` works faster than `I_MPI_SHM_HEAP_OPT=numa` but the `numa` optimization mode may consume smaller volume of shared memory.

## I\_MPI\_WAIT\_MODE

Control the Intel® MPI Library optimization for oversubscription mode.

### Syntax

`I_MPI_WAIT_MODE=<arg>`

### Argument

<code>&lt;arg&gt;</code>	Binary indicator
0	Optimize MPI application to work in the normal mode (1 rank on 1 CPU). This is the default value if the number of processes on a computation node is less than or equal to the number of CPUs on the node.
1	Optimize MPI application to work in the oversubscription mode (multiple ranks on 1 CPU). This is the default value if the number of processes on a computation node is greater than the number of CPUs on the node.

### Description

It is recommended to use this variable in the oversubscription mode.

## I\_MPI\_THREAD\_YIELD

Control the Intel® MPI Library thread yield customization during MPI busy wait time.

### Syntax

`I_MPI_THREAD_YIELD=<arg>`

### Argument

<code>&lt;arg&gt;</code>	Binary indicator
0	Do nothing for thread yield during the busy wait (spin wait). This is the default value when <code>I_MPI_WAIT_MODE=0</code>
1	Do the <code>pause processor</code> instruction for <code>I_MPI_PAUSE_COUNT</code> during the busy wait.
2	Do the <code>shied_yield()</code> system call for thread yield during the busy wait. This is the default value when <code>I_MPI_WAIT_MODE=1</code>
3	Do the <code>usleep()</code> system call for <code>I_MPI_THREAD_SLEEP</code> number of microseconds for thread yield during the busy wait.

### Description

`I_MPI_THREAD_YIELD=0` or `I_MPI_THREAD_YIELD=1` in the normal mode and `I_MPI_THREAD_YIELD=2` or `I_MPI_THREAD_YIELD=3` in the oversubscription mode.

---

## I\_MPI\_PAUSE\_COUNT

Control the Intel® MPI Library pause count for the thread yield customization during MPI busy wait time.

### Syntax

I\_MPI\_PAUSE\_COUNT=<arg>

### Argument

<arg>	Description
>=0	Pause count for thread yield customization during MPI busy wait time.  The default value is 0. Normally, the value is less than 100.

### Description

This variable is applicable when I\_MPI\_THREAD\_YIELD=1. Small values of I\_MPI\_PAUSE\_COUNT may increase performance, while larger values may reduce energy consumption.

## I\_MPI\_THREAD\_SLEEP

Control the Intel® MPI Library thread sleep microseconds timeout for thread yield customization while MPI busy wait progress.

### Syntax

I\_MPI\_THREAD\_SLEEP=<arg>

### Argument

<arg>	Description
>=0	Thread sleep microseconds timeout. The default value is 0. Normally, the value is less than 100.

### Description

This variable is applicable when I\_MPI\_THREAD\_YIELD=3. Small values of I\_MPI\_PAUSE\_COUNT may increase performance in the normal mode, while larger values may increase performance in the oversubscription mode

## I\_MPI\_EXTRA\_FILESYSTEM

Control native support for parallel file systems.

### Syntax

I\_MPI\_EXTRA\_FILESYSTEM=<arg>

### Argument

<arg>	Binary indicator
enable   yes   on   1	Enable native support for parallel file systems.

disable   no   off   0	Disable native support for parallel file systems. This is the default value.
------------------------	--

### Description

Use this environment variable to enable or disable native support for parallel file systems.

## I\_MPI\_EXTRA\_FILESYSTEM\_FORCE

### Description

Force filesystem recognition logic.

### Syntax

I\_MPI\_EXTRA\_FILESYSTEM\_FORCE=<ufs|nfs|gpfs|panfs|lustre>

---

# Miscellaneous

---

This topic provides the following information:

- [Java\\* Bindings for MPI-2 Routines](#) describes the Java language support by Intel® MPI Library.

## Java\* Bindings for MPI-2 Routines

---

Intel® MPI Library provides an experimental feature to enable support for Java\* MPI applications. Intel MPI Library provides Java bindings for a subset of MPI-2 routines.

You can find all supported MPI routines in the table below. All the classes below belong to the `mpi` package.

---

### NOTE

- For static methods, parameters fully correspond to the ones of C routines.
  - For non-static methods, the object that calls the method corresponds to the `OUT` parameter of the original C routine.
- 

### Java\* Bindings for MPI-2 Routines

Java Class	Public Fields and Methods	Original C Routine
MPI	<code>static int Init(String[] args)</code>	<code>MPI_Init</code>
	<code>static void Finalize()</code>	<code>MPI_Finalize</code>
	<code>static double wTime()</code>	<code>MPI_Wtime</code>
	<code>static void abort(Comm comm, int errorCode)</code>	<code>MPI_Abort</code>
	<code>String getProcessorName()</code>	<code>MPI_Get_processor_name</code>
Aint	<code>static void getExtent(Datatype dt, Aint lb, Aint extent)</code>	<code>MPI_Type_get_extent</code>
	<code>static void getTrueExtent(Datatype dt, Aint true_lb, Aint true_extent)</code>	<code>MPI_Type_get_true_extent</code>
	<code>static void getAddress(long location, Aint address)</code>	<code>MPI_Get_address</code>
	<code>static void getContents(Datatype dt, int maxIntegers, int maxAddresses, int maxDatatypes, int[] integers, Aint[] addresses, Datatype[] datatypes)</code>	<code>MPI_Type_get_contents</code>
Collective	<code>static void allToAll(Object sendbuf, int sendcount, Datatype sendtype, Object recvbuf, int recvcount, Datatype recvttype, Comm comm)</code>	<code>MPI_Alltoall</code>

Java Class	Public Fields and Methods	Original C Routine
	static void reduce(Object sendbuf, Object recvbuf, int count, Datatype type, Op op, int root, Comm comm)	MPI_Reduce
	static void bcast(Object buffer, int count, Datatype type, int root, Comm comm)	MPI_Bcast
	static void gather(Object sendBuffer, int sendCount, Datatype sendType, Object recvBuffer, int recvCount, Datatype recvType, int root, Comm comm)	MPI_Gather
	static void gatherv(Object sendBuffer, int sendCount, Datatype sendType, Object recvBuffer, Object recvCount, Object displs, Datatype recvType, int root, Comm comm)	MPI_Gatherv
	static void allGather(Object sendBuffer, int sendCount, Datatype sendType, Object recvBuffer, int recvCount, Datatype recvType, Comm comm)	MPI_Allgather
	static void allGatherv(Object sendBuffer, int sendCount, Datatype sendType, Object recvBuffer, Object recvCount, Object displs, Datatype recvType, Comm comm)	MPI_Allgatherv
	static void allReduce(Object sendbuf, Object recvbuf, int count, Datatype type, Op op, Comm comm)	MPI_Allreduce
	static void allToAllv(Object sendbuf, Object sendCount, Object sdispls, Datatype sendType, Object recvbuf, Object recvCount, Object rdispls, Datatype recvType, Comm comm)	MPI_Alltoallv
	static void reduceScatter(Object sendbuf, Object recvbuf, Object recvcounths, Datatype type, Op op, Comm comm)	MPI_Reduce_scatter
	static void scatter(Object sendBuffer, int sendCount, Datatype sendType, Object	MPI_Scatter

Java Class	Public Fields and Methods	Original C Routine
Comm	recvBuffer, int recvCount, Datatype recvType, int root, Comm comm)	
	static void scatterv(Object sendBuffer, Object sendCount, Object displs, Datatype sendType, Object recvBuffer, int recvCount, Datatype recvType, int root, Comm comm)	MPI_Scatterv
	static void barrier(Comm comm)	MPI_Barrier
	<b>Static field:</b> Comm WORLD	MPI_COMM_WORLD
	<b>Static field:</b> Comm SELF	MPI_COMM_SELF
	int getSize()	MPI_Comm_size
	int getRank()	MPI_Comm_rank
	Comm create(Group group)	MPI_Comm_create
	static Comm create(Comm comm, Group group)	MPI_Comm_create
	Comm dup()	MPI_Comm_dup
Group	Comm split(int color, int key)	MPI_Comm_split
	<b>Static field:</b> int MPI_PROC_NULL	MPI_PROC_NULL
	<b>Static field:</b> int MPI_IDENT	MPI_IDENT
	<b>Static field:</b> int MPI_CONGRUENT	MPI_CONGRUENT
	<b>Static field:</b> int MPI_SIMILAR	MPI_SIMILAR
	<b>Static field:</b> int MPI_UNEQUAL	MPI_UNEQUAL
	<b>Static field:</b> Group WORLD	MPI_GROUP_WORLD
	void group(Comm comm)	MPI_Comm_group
	int getSize()	MPI_Group_size
	int getRank()	MPI_Group_rank
	int MPI_Group_translate_ranks(int[] ranks1, Group group2, int[] ranks2)	MPI_Group_translate_ranks
	static int MPI_Group_translate_ranks(Group group1, int[] ranks1, Group group2, int[] ranks2)	MPI_Group_translate_ranks
	int MPI_Group_compare(Group group2)	MPI_Group_compare
	int MPI_Group_union(Group group1, Group group2)	MPI_Group_union
	int MPI_Group_intersection(Group group1, Group group2)	MPI_Group_intersection
	int MPI_Group_difference(Group group1, Group group2)	MPI_Group_difference
	int MPI_Group_incl(Group group, int n, int[] ranks)	MPI_Group_incl
	int MPI_Group_excl(Group group, int n, int[] ranks)	MPI_Group_excl

Java Class	Public Fields and Methods	Original C Routine
Datatype	Static field: Datatype NULL	MPI_DATATYPE_NULL
	Static field: Datatype BYTE	MPI_UINT8_T
	Static field: Datatype CHAR	MPI_CHAR
	Static field: Datatype SHORT	MPI_INT16_T
	Static field: Datatype BOOLEAN	MPI_UINT8_T
	Static field: Datatype INT	MPI_INT32_T
	Static field: Datatype LONG	MPI_INT64_T
	Static field: Datatype FLOAT	MPI_FLOAT
	Static field: Datatype DOUBLE	MPI_DOUBLE
	Static field: Datatype PACKED	MPI_PACKED
	Static field: Datatype INT2	MPI_2INT
	Static field: Datatype SHORT_INT	MPI_SHORT_INT
	Static field: Datatype LONG_INT	MPI_LONG_INT
	Static field: Datatype FLOAT_INT	MPI_FLOAT_INT
	Static field: Datatype DOUBLE_INT	MPI_DOUBLE_INT
	Static field: Datatype FLOAT_COMPLEX	MPI_C_FLOAT_COMPLEX
	Static field: Datatype DOUBLE_COMPLEX	MPI_C_DOUBLE_COMPLEX
	void contiguous(int count, Datatype type)	MPI_Type_contiguous
	void commit()	MPI_Type_commit
	int getTypeSize()	MPI_Type_size
	void free()	MPI_Type_free
	void vector(int count, int blockLength, int stride, Datatype baseType)	MPI_Type_vector
	void hvector(int count, int blockLength, int stride, Datatype oldType)	MPI_Type_create_hvector
	void indexed(int count, int[] blockLength, int[] displacement, Datatype oldType)	MPI_Type_indexed
	void hindexed(int count, int[] blockLength, Aint[] displacement, Datatype oldType)	MPI_Type_create_hindexed
	void struct(int count, int[] blockLength, Aint[] displacement, Datatype[] oldTypes)	MPI_Type_struct
Op	Static field: Op MPI_OP_NULL	MPI_OP_NULL
	Static field: Op MPI_MAX	MPI_MAX
	Static field: Op MPI_MIN	MPI_MIN
	Static field: Op MPI_SUM	MPI_SUM
	Static field: Op MPI_PROD	MPI_PROD
	Static field: Op MPI_LAND	MPI_LAND
	Static field: Op MPI_BAND	MPI_BAND
	Static field: Op MPI_LOR	MPI_LOR

Java Class	Public Fields and Methods	Original C Routine
UserFunction (abstract)	Static field: Op MPI_BOR	MPI_BOR
	Static field: Op MPI_LXOR	MPI_LXOR
	Static field: Op MPI_BXOR	MPI_BXOR
	Static field: Op MPI_MINLOC	MPI_MINLOC
	Static field: Op MPI_MAXLOC	MPI_MAXLOC
	Op (UserFunction uf)	-
	void	-
	setUserFunction (UserFunction userFunction)	
	void createOP (boolean commute)	MPI_Op_Create
	UserFunction (Datatype type, int length)	-
PTP	void setInoutvec (ByteBuffer inoutvec)	-
	void setInvec (ByteBuffer invec)	-
	abstract void call (int type, int length)	-
	static void send (Buffer buffer, int count, Datatype type, int dest, int tag, Comm comm)	MPI_Send
	static void send (<java array> buffer, int count, Datatype type, int dest, int tag, Comm comm)	MPI_Send
	static Status recv (Buffer buf, int count, Datatype type, int source, int tag, Comm comm)	MPI_Recv
	static Status recv (<java array> buf, int count, Datatype type, int source, int tag, Comm comm)	MPI_Recv
	static Request isend (Buffer buffer, int count, Datatype type, int dest, int tag, Comm comm)	MPI_Isend
	static Request isend (<java array> buffer, int count, Datatype type, int dest, int tag, Comm comm)	MPI_Isend
	static Request irecv (Buffer buf, int count, Datatype type, int source, int tag, Comm comm)	MPI_Irecv
	static Request irecv (<java array> buf, int count, Datatype type, int source, int tag, Comm comm)	MPI_Irecv
	static Status sendRecv (Buffer sendbuf, int sendcount, Datatype	MPI_Sendrecv

Java Class	Public Fields and Methods	Original C Routine
Request	<pre> sendtype, int senddest, int sendtag, Buffer recvbuf, int recvcount, Datatype recvtype, int recvsource, int recvtag, Comm comm) Status Wait() static Status[] waitAll(int count, Request[] reqs) static Status waitAny(int count, Request[] reqs, int[] index) static Status[] waitSome(int count, Request[] reqs, int[] outcount, int[] indexes) boolean test(Status status) </pre>	<pre> MPI_Wait MPI_Waitall MPI_Waitany MPI_Waitsome MPI_Test </pre>
