Revision History

Revision Number	Description	Revision Date
1.0	Initial release.	January 2013
2.0	Completed major documentation updates and renamed to EMON User's Guide. Added Installation and Examples chapters. Updated examples in section 2.2 General Options: Collection.	February 2016
2.1	Added and removed event modifiers.	February 2017
2.2	Updated SEP driver version.	April 2017
2.3	Updated examples in chapters 3 and 4.	September 2017
2.4	Updated the guide with missing options and added description where required.	June 2018
2.5	Minor updates to commands.	February 2019
2.6	Added "Collect and Process EDP Metrics" section	April 2022
2.7	Dropped -process-edp option	April 2023
2.8	Added details about data collection on hybrid platforms	August 2023
2.9	Added -per-cpu-absolute-tsc option details	October 2023

… - ³ ² ˜ ¦ § ± ˆ - ¡ ³ « £ ¬ ²

1

EMON is a low-level command-line tool that provides the ability to profile application and system performance. The tool leverages counters from hardware Performance Monitoring Units (PMUs) to collect performance monitoring events.

Users have the option of specifying hardware events and attributes. EMON allocates and configures the required event resources in the PMU to retrieve event counts from the processor core and uncore. The tool collects the number of occurrences of selected events for the duration of collection.

• ¬ ² £ ¬ ¢ £ ¢ … ³ ¢ § £ ¬ ¡ £

– £ ª Ÿ ² £ ¢ • ¬ ¤ - ° « Ÿ ² § - ¬

For information on Performance Monitoring Unit (PMU), go to http://www.intel.com/content/www/us/en/processors/architectures-software-developer-manuals.html.

• ¬ ² ° - ¢ ³ ¡ ² § - ¬

This document explains how you install EMON inside a docker container(along with dependencies) and collect data. Although the collection runs within the container, you can collect data from the entire system. This docker-based distribution is useful when you deploy the tool across multiple nodes.

The docker distribution feature is available for Linux* OS only.

This is a **PREVIEW FEATURE**. A preview feature may or may not appear in a future production release. It is available for your use in the hopes that you will provide feedback on its usefulness and help determine its future. Data collected with a preview feature is not guaranteed to be backward compatible with future releases.

This guide explains how you use the following scripts to install and run EMON commands in a container.

Script	Purpose
Dockerfile	Build a docker image
emon_container.py	Interface to create EMON image and launch EMON commands
utility.py, helper.py	Helper scripts
sample.sh	Sample script to launch EMON commands and workload

With a docker-based deployment distribution, you can

- Run an EDP collection
- Run EMON commands
- Use a script to run workload and EMON commands

• ¬ ¤ - ° « Ÿ ² § ´ £ “ ® ² § - ¬ ±

This section lists all EMON options with examples to illustrate the behavior of certain options.

\¦ b [ª § ± ² [£ ´ £ ¬ ² [« - ¢ § ¤ § £ ° ± c

Display help information. The tool lists and describes all supported event modifiers if the sub-option `-list-event-modifiers` is specified. For details on event modifiers, see Event Modifiers.

\ ® « ³ [² · ® £ ± b Ÿ ´ Ÿ § ª Ÿ ª £ c

Display the PMU types supported by the platform. Add the ‘available’ parameter to display PMU types available on the current system.

[b ® « ³ [² · ® £ c b [£ ¶ ® £ ° § « £ ¬ ² Ÿ ª T [Ÿ ª ª c

List the event names that can be monitored on the host platform. This command excludes events that are not available in the system even though the tool supports their collection. For example, if a system does not have an FPGA, all events related to FPGA are ignored.

```
-bash-4.2$ emon -l
INST_RETIRED.ANY
CPU_CLK_UNHALTED.THREAD
CPU_CLK_UNHALTED.THREAD_ANY
CPU_CLK_UNHALTED.REF_TSC
LD_BLOCKS.STORE_FORWARD
LD_BLOCKS.NO_SR
...
```

Event list can be filtered by adding a PMU type from `-pmu-types` command. For example:

```
emon -1 core
```

Experimental events are those events that have not been validated in hardware. To list experimental along with regular events, use the following command:

```
emon -1 -experimental
```

To list all events that the tool supports on the current platform, use the following command:

```
emon -1 -all
```

NOTE With `-all` option, the command lists experimental events, deprecated events, template events, and all other events enabled for the given platform.

[T [Œ b®«³[²·®£c b[£¶®£°§«£¬²Ÿª T [Ÿªªc

Print events that can be monitored on the host platform along with a brief description. This command excludes events that are not available in the system even though the tool provides support for them. For example, if a system does not have an FPGA, all events related to FPGA are ignored.

```
-bash-4.2$ emon -?
INST_RETIRED.ANY
        Instructions retired from execution.
CPU_CLK_UNHALTED.THREAD
        Core cycles when the thread is not in halt state
CPU_CLK_UNHALTED.THREAD_ANY
        Core cycles when at least one thread on the physical core is not in halt
 state.
```

Event list can be filtered by adding a PMU type from `-pmu-types` command.

For example:

```
emon -? core
```

Experimental events are those events that have not been validated in hardware. To list experimental along with regular events, use the following command:

```
emon -? -experimental
```

To list all events that the tool supports on the current platform, use the following command:

```
emon -? -all
```

NOTE This command lists experimental events, deprecated events, template events, and all other events enabled for the given platform.

[G£´£¬² ¬Ÿ«£H

Print description of a given event.

```
-bash-4.2$ emon -! INST_RETIRED.ANY
INST_RETIRED.ANY
        Instructions retired from execution.
```

If the given event does not have the relevant hardware support in the current system, EMON displays a warning saying that the event is not available for collection in the system.

[[¢°·[°³¬

Lists event groups with names of events that will be scheduled together. In the following example, EMON splits the command execution into two runs. The first execution includes events under `Event Set 0`, and second execution includes those under `Event Set 1`.

```
-bash-4.2$ emon --dry-run -C "INST_RETIRED.ANY,LONGEST_LAT_CACHE.REFERENCE;BR_IN
ST_RETIRED.ALL_BRANCHES,BR_MISP_RETIRED.ALL_BRANCHES"
Event Set 0
        INST_RETIRED.ANY
        LONGEST_LAT_CACHE.REFERENCE
Event Set 1
        BR_INST_RETIRED.ALL_BRANCHES
        BR_MISP_RETIRED.ALL_BRANCHES
```

[‘

Print the operating system (OS) processor to hardware logical/physical processor mapping.

[´ b[¢§±®ªŸ·[¤£Ÿ²³°£±c

Display build and version information of the tool along with other details about the hardware platform. This option also prints the mapping of the OS processor to the logical/physical processor of the hardware. Use the `-display-features` option with this command to display the capabilities supported in this version of driver.

```

‰´£¬² ‡-ªª£¡²§-¬ “®²§-¬±

EMON collects event data for processor core and uncore. This section lists all EMON options related to data collection with examples to illustrate the behavior of certain options.

[‡ G£´£¬² £´£¬² H

Specify one or more events for which the performance data will be collected. Events to monitor can optionally be embedded within double-quotes (") and should be separated by a comma (,). Both core and uncore events can be specified for monitoring. However, when user specifies only uncore events in the command line, the tool collects all the fixed core events along with the specified uncore events.

```
-bash-4.2$ emon -C "INST_RETIRED.ANY,BR_INST_RETIRED.ALL_BRANCHES"

ˆŸ²Ÿ ‡-ªª£¡²§-¬ Ÿ¬¢ ‰´£¬² ‘³ª²§®ª£¶§¬¥

The number of events that can be monitored simultaneously in a single run is limited by the number of hardware performance counters in the PMU of a processor. Certain events have restrictions that disallows their programming in all counters.

To overcome the limitation of available performance counters on the hardware, EMON splits events into multiple event groups. Each group consists of events that can be collected simultaneously in a single run. The tool schedules an independent data collection for each event group. Events are split in to multiple groups under following two conditions:

- If all events specified in the command line cannot fit into available performance counters on the platform, the tool automatically splits them in to multiple groups.
- User can control splitting of events in to groups while specifying event lists in the command line. To do so, use a semicolon to demarcate group separation instead of using a comma. To understand this use case, see Multi-group Core Events.

‰´£¬² ‘-¢§¤§£°±

Individual core/uncore event behavior can be modified using modifiers. The `[:modifier=val]` option enables you to specify individual event modifiers along with the respective values for a given platform.

Event modifiers are attached to event names delimited by a colon `(:)`. They may or may not take values. Where applicable, values are of the following format: `<yes/no>`, `<0/1>`, `<dec/hex values>`. In some special cases explicitly mentioned, they could take other string values.

†Ÿ±§¡ ‰´£¬² ‘-¢§¤§£°±

The following table lists the basic event modifiers and provides a short description of each modifier.

Modifier	Description
`:USER | :usr=<0/1>`	Specifies that events are counted only when the processor is operating at privilege levels 1, 2, or 3. This flag can be used in conjunction with the SUP flag.
`:SUP|:os`	Specifies that events are counted only when the processor is operating at privilege level 0. This flag can be used in conjunction with the USER flag.
`:ALL`	Event data is collected regardless of the current privilege level.
`:cp`	In Check Point. When this modifier is specified, the data result will not include counts that occurred inside of an aborted Intel® Transactional Synchronization eXtensions (Intel® TSX) region.
`:tx`	In Transaction. When this modifier is specified, the data result will only include counts that occurred inside an Intel® TSX region, regardless of whether that region was aborted or committed.
`:perf_metrics`	Enable hardware based top-down metrics. This modifier is ignored on all events except for the fixed event `TOPDOWN.SLOTS`.
`:ocr_msr_val=<value>`	Override the default offcore MSR programming with the user specified value for the event.

…¢´Ÿ¬¡£¢ ‰´£¬² ‘-¢§¤§£°±

The following table lists the event modifiers for more advanced users with an understanding of hardware PMU.

Modifier	Description
:amt<0/1>	Sets (1) or clears (0) the event's Any Thread control bit. A value of 0 causes the event to be counted on a per logical core basis, when applicable. A value of 1 causes the event to be counted on a per physical core basis. Please note that this feature is not supported on 10th generation Intel Core Processors and 3rd generation Intel Xeon Scalable Processors or newer.
:c<cmask>	Value that will be compared to the count of the specified event during a single cycle per core. If the event count is greater than or equal to this value, the counter is incremented by one; otherwise, the counter is not incremented. The value must be in the range of 0x0 to 0xff.
:e<0/1>	Enables (when set) edge detection of the selected microarchitectural condition. The logical processor counts the number of deasserted to asserted transitions for any condition that can be expressed by the other fields. For example, `emon -l1 -t0.1 -C "MACHINE_CLEARS.COUNT, MACHINE_CLEARS.COUNT:e1:c1"`
:i<0/1>	When the invert flag is set, inverts :c <cmask> comparison, so that both greater than or equal to and less than comparisons can be made (<0>: greater than equal to comparison, <1>: less than comparison). Invert flag is ignored when :c<cmask> is programmed to 0. A value of 0 disables invert and 1 enables it.
:u<umask>	<umask> indicates the value of the event's unit mask to identify a specific microarchitectural condition. The <umask> value must be in the range 0x0 to 0xff.
:p<0/1>	When set, enables toggling of PMi pin for each event occurrence rather than during counter overflow.
:request=<request name as string>	Programming request type in the off-core response facility for a transaction request to the uncore. The request type specification must be accompanied by a response type.
:response=<response name as string>	Programming response type in the off-core response facility for a transaction request to the uncore. The response type specification must be accompanied by a request type.
:t=<threshold_num>	Threshold programming for uncore PMON_CTLx register. For events that increment more than 1 per cycle, if the threshold value is greater than 1, the data register will accumulate instances in which the event increment is >= threshold.
:rx_match=<value> :rx_mask=<value> :tx_match=<value> :tx_mask=<value>	Modifiers are all applicable to uncore Intel® QuickPath Interconnect (Intel® QPI) for programming filter registers.

Modifier	Description
:state=<value>	Applicable to uncore CHA to program state bit field of filter MSR_0.
:tid=<value>	Applicable to uncore CBO to program tid bit field of filter MSR_0.
:filter0=<value>	Applicable to CBO/CHA to program filter MSR_0.
:filter1=<value>	Applicable to CBO/CHA to program filter MSR_1.
:nc=<value>	Applicable to CBO/CHA to filter non-coherent requests by programming nc bit field of filter MSR_1.
:opc=<value>	Applicable to CBO/CHA to filter events based on their OPCODE by programming opc bit field of filter MSR_1.
:nid=<value>	Applicable to CBO/CHA to filter events by programming nid bit field of filter MSR_1.
:msr=<msr_index>	Read static and freerun event counts based on msr index provided in the command line.
:scope=<thread/ Module/package>	Set scope for power events specified through :msr event modifier. The scope needs to be one of the 3 strings from the modifier column.
:type=<static/ Freerun>	Set type of power events specified through :msr event modifier. The event type needs to be one of 2 string from the modifier column.
:ccst_debug= <hex_num>	Applicable to Power Control Unit (PCU) for programming debug MSR.
:umask_ext=<value>	Enables setting extended umask bits in the counter control register when used with applicable uncore events.

[® ° £ ± £ ² [ª § ± ²

Presets are predefined event sets made available by the tool. This option lists all available presets.

```
-bash-4.2$ emon -preset-list
Preset[pgx] :
Platform Guided Exploration:  Top-Down analysis model for all system components

Preset[pgx] :

Preset[pgx] :
Platform Guided Exploration:  Top-Down analysis model for all system components
```

[® ° £ ± £ ² G ¬ Ÿ « £ H

Collect data for the given preset. To obtain available presets, use `emon -preset-list` command. Presets cannot be used along with `-C` option. When presets are used in combination with `-V` or `-S` options, EMON generates spreadsheet-friendly output.

```
-bash-4.2$ emon -preset pgx

Time (seconds) that an event set is monitored for. Default value is 3 s. To run EMON for the duration of application execution, use `-t0` along with an application. EMON kills the application after it finishes executing all given event sets for the specified duration when `-t0` is not specified.

The following command executes until matrix application finishes:

```
emon -t0 -C "INST_RETIRED.ANY" matrix "4 4096"
```

The following command kills the application and terminates after 10 s:

```
emon -t10 -C "INST_RETIRED.ANY" matrix "4 4096"
```

[ª Gª--®±H

The number of times each event set is monitored. Default value is 1. Event sets are interleaved.

For example, if two events sets A and B are specified and time equals 4 and loops equal 2, event set A is monitored for 4 seconds, and then event set B is monitored for 4 seconds, and then event set A is monitored for 4 seconds, and, finally, event set B is monitored for 4 seconds.

```
-bash-4.2$ emon -t4 -l2 -C "INST_RETIRED.ANY,BR_INST_RETIRED.ALL_BRANCHES"

```

When launched with an application and the total monitoring time is less than application execution time, EMON kills the application after executing all loops. In the following example, each loop runs for 3 s for a total duration of 6 s, after which EMON would kill matrix application and exit:

```
emon -l2 -C "INST_RETIRED.ANY" matrix "16 8192"
```

When specified with an application and the total monitoring time is greater than application execution time, EMON continues executing loops in the remaining time. In the following example, each loop runs for 3 s for a total duration of 30 s while matrix application is expected to finish much sooner:

```
emon -l10 -C "INST_RETIRED.ANY" matrix "2 1024"
```

When specified with time 0 s and an application, EMON executes each loop for the duration of application execution. For example, in the following command assuming matrix application takes about 6 s to complete, each loop could run for ~6 s for a total duration of 18 s:

```
emon -t0 -l3 -C "INST_RETIRED.ANY" matrix "2 1024"
```

[• G²§«£H

Range for random delay of the monitor interval, specified in seconds. A random delay of 0 s to `<time>` is introduced between each sample. When used, each monitor interval is the value of the `-t switch` plus the random delay between 0 and `<time>` milliseconds. Defaults to 0 m. This functionality will be automatically disabled if `-t switch` is set to 0 s.

```
-bash-4.2$ emon -t1 -L0.5 -l5 -C CPU_CLK_UNHALTED.REF_TSC

Start EMON collection in the background.

[®

Start EMON in paused state. If collection is never resumed, EMON exits after monitoring interval ends. In the following example, EMON would exit after 3 s if the collection is never resumed using `emon -resume`.

```
-bash-4.2$ emon -p -C "INST_RETIRED.ANY"
Version Info: public V10.1.0 (Feb  1 2018 at 10:02:03) Intel(R) Processor code named S
kylake M:94 S:0

Emon collector successfully paused.
Emon collector was started in PAUSE mode and never RESUMED
```

[- ± « T [- ± [« - ¢ £

Collect data for operating system processes only.

[³ « T [³ ± £ ° [« - ¢ £

Collect data for user-mode processes only.

[® Ÿ ³ ± £

When EMON is running in non-blocking mode or in the background, use `emon -pause` to pause a running collection.

If EMON is running in the foreground, use the following steps to pause collection:

1. Open a Bash* shell, and then set up EMON run time environment by sourcing `sep_vars.sh` file in the current Bash* shell.

For example, if EMON is installed in `/opt/intel/emon`, `source /opt/intel/emon/sep_vars.sh`.

2. From the new shell, issue `emon -pause` to pause collection.

Collection ends if the total monitoring time elapses while paused.

[°£±³«£

When EMON is running in non-blocking mode or in the background, use `emon -resume` to resume a paused collection.

If EMON is running in the foreground, use the following steps to resume collection:

1. Open a Bash* shell, and then set up EMON run time environment by sourcing `sep_vars.sh` file in the current Bash* shell.

   For example, if EMON is installed in `/opt/intel/emon`, `source /opt/intel/emon/sep_vars.sh`.
2. From the new shell, issue `emon -resume` to resume collection.

[±²-®

When EMON is running in non-blocking mode or in the background, use `emon -stop` to stop a running collection.

If EMON is running in the foreground, use the following steps to stop collection:

1. Open a Bash* shell, and then set up EMON run time environment by sourcing `sep_vars.sh` file in the current Bash* shell.

   For example, if EMON is installed in `/opt/intel/emon source /opt/intel/emon/sep_vars.sh`.
2. From the new shell, issue `emon -stop` to stop collection.

•¬®32`“32®32 “®2§-¬±

This section lists all options related to tool input/output with examples to illustrate the behavior of certain options. The default output mode is text-based command-line output. Additionally, EMON provides options to generate text or spreadsheet output in to files.

[¤ G-32®32 ¤§ª£H

EMON output is written to `<output file>`. The `-f switch` creates a new output file.

[Š G-32®32 ¤§ª£H

EMON output is appended to `<output file>`. If `<output file>` does not exist, it will be created.

[§ G§¬®32 ¤§ª£H

EMON command-line arguments are provided by `<input file>`. Comments are indicated with a hashtag `(#)`. All text following a hashtag in an input file is ignored.

Create an input text file with desired options. Input options can be separated by spaces or new lines. Event list following `-C` can either use a new-line separator or a comma `(,)`. Use a semicolon `(;)` to start a new group.

```
-q -c  -t0.1 -l100000
-C (
# group 1
INST_RETIRED.ANY
CPU_CLK_UNHALTED.REF_TSC
CPU_CLK_UNHALTED.THREAD_ANY
IDQ_UOPS_NOT_DELIVERED.CORE
UOPS_ISSUED.ANY
;
# group 2
INST_RETIRED.ANY
CPU_CLK_UNHALTED.REF_TSC
CPU_CLK_UNHALTED.THREAD
UOPS_EXECUTED.THREAD
;
)
```

[¯

Default text output to command line. Minimal information is output.

[š

EMON generates output in a spreadsheet-friendly format. Use `-f` or `-F` options to create spreadsheet-friendly output files.

In this mode, data is hierarchically presented (`packages->devices->Specific Core/Uncore units->event counts`), making it easier to observe event counts on a particular core or uncore unit.

12.000s real
```

To calculate the final counts:

1. Calculate normalized count for each event across groups (i.e., add counts of all occurrences of an event across groups and divide the accumulated value by actual number of occurrences of that event in the groups).
2. Multiply normalized count by total number of scheduled groups.
3. If there is more than one loop, repeat steps 1 and 2 for each loop and add corresponding event counts from each loop.

[—

Compute-tool defined performance metrics using normalized event counts and display in a semicolon-separated, spreadsheet-friendly format. The normalized event counts are calculated from raw event counts described in `-A` option. Use `-f` or `-F` options to create spreadsheet-friendly output files.

```
emon -preset pgx -S
```

[— °

Behaves similar to `-S` option but additionally stores and displays raw event counts in a spreadsheet-friendly format.

```
emon -preset pgx -Sr ./raw_counts_file.csv -f ./metrics_file.csv
```

[œ

Spreadsheet-friendly format. The results are output in tab-separated format. This only works for single group collection.

[i

Print system time (date-time) for each time interval. It is only available in the command-line output.

```
-bash-4.2$ emon -c -l2 -C INST_RETIRED.ANY

Collect and process **EDP (EMON Data Processing)** event data to generate several performance metrics that provide an overview of system performance. Since the EDP event/metric/script files are integrated into the EMON package, no additional download is necessary for this purpose. When you use the options listed in this section, EMON selects the appropriate event/metric files to collect and process data.

Option	Action
`-collect-edp`	Collect data for several events
`-process-edp`	**NOTE** The -process-edp option is no longer supported. Please use the -process-pyedp option instead, which supports enhanced features and is much faster.
`-process-pyedp`	Process the data collected using the `-collect-edp` option. The data is automatically processed by a python script included in the package. Refer to the `-process-pyedp` section for more information.

™ ± Ÿ ¥ £

Here are some typical usage scenarios to collect and process EDP metrics:

- **Launch an EMON collection and an application or workload separately**

  Use the following steps if you cannot have EMON launch the application for you (for e.g. application is always running or has various phases but the collection is for a shorter duration).

  1. Collect and save the data to a file named emon.dat, run in the background if launching the workload in the same shell.

```
emon -collect-edp > emon.dat &
```

     Alternatively, specify the emon.dat file using the -f option.

```
emon -collect-edp -f emon.dat &
```

  2. Launch workload along with arguments.

```
<app_path_name> <app_arguments>
```

  3. Stop the emon collection explicitly since -collect-edp by default runs for a long time (several loops).

```
emon -stop
```

  4. Process the data with the default configuration, which works in most of the cases. Copy the template file to the current folder and use the default configuration.

```
cp <emon_install_dir>/config/edp/pyedp_config.txt .
```

  5. Process data using the default edp configuration file (modify to customize if needed). An EMON data file with the name `emon.dat` to be present in the current folder. This step generates several .csv/.xlsx result files with processed metrics.

```
emon -process-pyedp ./pyedp_config.txt
```

- **Launch an EMON collection along with an application or workload**

  Use the following steps for EMON to launch the application. The data collection happens until the application terminates. You do not have to stop the collection explicitly.

  1. Collect and save the data to a file named `emon.dat`. The application is launched by EMON. The -w option makes the collection to last until the application terminates and the -f option is used to save the data to `emon.dat` file

```
emon -collect-edp -f emon.dat -w <app_path_with arguments>
```

     If the application prints anything to console, create a script that launches the application and redirects it's output to a file. Launch the script via EMON.

```
emon -collect-edp -f emon.dat -w <app_script_path>
```

  2. Process with the default configuration, which works in most of the cases. Copy the template file to the current folder.

```
cp <emon_install_dir>/config/edp/pyedp_config.txt .
```

  3. Process data using the default edp configuration file (modify to customize if needed). An EMON data file with the name `emon.dat` to be present in the current folder. This step generates several .csv/.xlsx result files with processed metrics.

```
emon -process-pyedp ./pyedp_config.txt
```

[¡-ªª£¡²[£¢® b£¢®N¤§ª£DG¤§ª£N¬Ÿ«£Hc

Collect performance data for a list of predefined events to generate EDP metrics. This option detects the hardware platform and selects the corresponding EDP events file. This option covers core and various uncore performance blocks that are required for overall system characterization. By default, EMON uses a time interval of 100 ms when collecting event data.

```
emon -collect-edp
```

Various commonly useful scenarios of collect-edp option are listed below.

™±Ÿ¥£

- Collect EDP event performance data. Save the data to a file (`emon.dat`) in the current folder:

```
emon -collect-edp > emon.dat
```

- Specify a custom EDP event file:

```
emon -collect-edp edp_file=<edp_event_file>
```

- Launch an application/workload. Collect EDP data until the application terminates:

```
emon -collect-edp -w <application_path_and_arguments>
```

```
emon -collect-edp edp_file=<edp_event_file> -w <application_path_and_arguments>
```

- If the application/workload prints messages to the console, add the application command line to a script/batch file and redirect the output to a file (to avoid application output going into the EMON data file). Launch the script with EMON and collect EDP data until the application terminates:

```
emon -collect-edp -w <application_script>
```

```
emon -collect-edp edp_file=<edp_event_file> -w <application_script>
```

[®°-¡£±±[£¢® G£¢®N¡-¬¤§¥N¤§ªH

NoticeThe -process-edp option is no longer supported. Please use -process-pyedp option instead, which supports enhanced features and is much faster.

[®°-¡£±±[®·£¢® G®·£¢®N¡-¬¤§¥N¤§ªH

Process the EDP data collected with `-collect-edp` option and generate metric reports in .csv/.xlsx format.

This option requires a path to the PyEDP configuration file as an argument. The `<emon-install-dir>/config/edp` folder contains a template for a PyEDP configuration file (`pyedp_config.txt`). Copy this file to your local folder and change configuration information as needed. For most use cases, you may be able to use `pyedp_config.txt` without any modifications.

Syntax

```
emon -process-pyedp <path_to_pyedp_config_file>
```

”°£°£¯³§±§²£±

- Install Python 3.7 or later, pip, and virtualenv.
  - **Linux:** For example (Ubuntu):

```
sudo -E apt-get update;
sudo -E apt-get upgrade
sudo -E apt-get install python3
```

```
sudo -E apt-get install python3-pip
sudo -E apt-get install python3-dev
sudo -E apt-get install virtualenv
sudo -E apt-get install dos2unix
```

- **Windows:** Install Python from https://www.python.org/downloads. Then, install the virtualenv using the following command.

```
python -m pip install virtualenv
```

  - Install the Visual C++ 14.0 or later build tools (install Microsoft Visual Studio Build Tools and choose Desktop development with C++).

- Optionally, set up python virtual environment and install the python packages listed in the next section. In this case, the python virtual environment needs to be activated before processing data with EMON -process-pyedp option.

```
1. Virtual environment setup:
    python -m venv /path/to/env
    (e.g. python -m venv ./edp-venv)
2. Activate virtual environment:
    C:\path\to\venv\script\activate (Windows)
    source /path/to/venv/bin/activate (Linux)
3. Install
    python -m pip install .
   (installs the following python packages and their dependencies - numpy, pandas,
    defusedxml, pytz, tdigest, xlsxwriter, and jsonschema)
```

- If not using python virtual environment, install the following python packages by running the command below for each package (replace package_name with the name of each package).
  - accumulation-tree
  - attrs
  - blosc2
  - colorama
  - cython
  - defusedxml
  - dill
  - jsonschema
  - msgpack
  - multiprocess
  - natsort
  - numexpr
  - numpy
  - packaging
  - pandas
  - py-cpuinfo
  - pyrsistent
  - python-dateutil
  - pytz
  - pyudorandom
  - six
  - tables
  - tdigest
  - tqdm
  - tzdata
  - xlsxwriter
  - referencing
  - jsonschema-specifications

- rpds-py

```
python -m pip install <package_name>
```

”·²¦-¬ Ÿ±£¢ ‰ˆ” ‡-¬¤§¥³°Ÿ²§-¬ ”Ÿ°Ÿ«£²£°±

The `pyedp_config.txt` file contains several configuration parameters that define the data processing options. Change settings to customize the processing of collected data.

Configuration Parameter	Default Value	Purpose	Additional Details
PYTHON_PATH	python3	Specify the python package to process data.	
EMON_DATA	emon.dat	Save EMON output to a file.	Change the value to specify a different file name (along with a path to the file).
METRICS	Commented out	Specify a custom file to use for metric calculation during data processing.	Uncomment and change the value to specify a custom metric file. EMON by default uses the relevant metric file for the hardware platform.
OUTPUT	summary.xlsx	Save the generated summary spreadsheet that contains performance metrics data.	
CHART_FORMAT	Commented out	Specify a custom file that lists the format for the charts to be generated in the spreadsheet.	Uncomment and change the value to specify a custom chart format file. EMON by default uses the relevant chart format file for the hardware platform.
BEGIN	Commented out	Specify the start of the sample number to process. Specify the start of the sample numbers (for example, BEGIN=1 and END=100000) to be used to process the data. Specify a sample number or a timestamp (MM/DD/YYYY HH:MM:SS).	The `BEGIN` values can also be the time stamps for the starting wall clock time. For example, `BEGIN="08/24/2012 17:53:20.885"`. The BEGIN and END settings can be used to process a subset of EMON data collected.
END	Commented out	Specify the end of the sample numbers (for example, BEGIN=1 and END=100000) to be used to process the data. Specify a sample number or a timestamp (MM/DD/YYYY HH:MM:SS).	The `END` values can also be the time stamps for the ending wall clock time. For example, `END= "08/24/2012 17:53:35"`. The BEGIN and END settings can be used to process a subset of EMON data collected.

Configuration Parameter	Default Value	Purpose	Additional Details
VIEW	--socket-view --core-view --thread-view --uncore-view	Generate a combination of socket/core/thread views of the metrics data. If the socket/core/thread detailed views are not required, specify --no-detail-views, which makes the data processing faster. --uncore-view (new option) - generates uncore views based on the available uncore devices for which events were collected. Separate reports per uncore device are generated.	Values for this option can be a space-separated combination of `--socket-view`, `--core-view`, and `--thread-view`. Add --no-detail-views to only generate summary views.
FREQUENCY	Commented out	Specify TSC frequency in MHz (e.g. 1600) to override the measured value by EMON or in case the data is not available.	
TPS	Commented out	Number of transactions per second (TPS) for throughput-mode reports.	
PERCENTILE	95	Percentile value (integer) to include in the output, this value can be changed	Comment out if percentile is not required in the output, which makes the metric processing faster.
PARALLELISM	Commented out (uses all the threads available to process the data)	Number of threads to process data in parallel. Typically it should equal to the number of logical CPUs in your processing system.

Introduction to Hybrid Platforms

The Intel client architectures starting from 12th gen are based on a hybrid model with Performance Core (P-Core) and Efficiency Core (E-Core). Depending on the application, hybrid CPU architectures can distribute core usage more efficiently than non-hybrid architectures. P-Cores are designed to handle complex workloads while E-Cores are better suited for multi-threaded throughput and power-limited scenarios. At higher power envelopes, P-Cores can provide better performance than E-Cores. At lower power envelopes, E-Cores are more desirable. Each core type has different specifications and system configurations.

For these reasons, the P-Cores are preferred for

- Priority tasks
- Limited threading applications

while E-Cores are better suited for:

- Power-limited scenarios
- Background applications that can meet their QOS (Quality of Service) requirements on that performance

—³®®-°²£¢ ‡-°£ ˜·®£±

To collect samples using EMON on hybrid platforms, you must first identify the core types that are supported on your system. To do this, run:

```
emon -pmu-types
```

For example, this output indicates that two core types supported by EMON tool on the system: `bigcore` and `smallcore`

```
$ emon -pmu-types
PMU Types supported on this platform:
bigcore
smallcore
imc
cbo
hac_cbo
ncu
hac_ncu
ufibridge
power
```

NOTE EMON notates P-Core as `bigcore` and E-Core as `smallcore`.

…´Ÿ§ªŸ ª£ ‡-°£ ˜·®£±

Once you have identified the core types supported by your system, find out the core types that are available. Run:

```
emon -pmu-types available
```

In this example, there are two core types available on the system: `bigcore` and `smallcore`.

```
$ emon -pmu-types available
PMU Types available on this machine:
bigcore
smallcore
imc
cbo
hac_cbo
ncu
hac_ncu
ufibridge
power
```

Note that a core type supported by your system will not display in this output unless it is actually available on your system.

‡-°£ ˜·®£ —®£¡§¤§¡Ÿ²§-¬± -¬ Œ· °§¢ ”ªŸ²¤-°«±

Each core type has different specifications (such as cache, number of PerfMon counters etc) and system configurations on hybrid platforms.

To see the core type specification, run:

```
emon -v
```

This command displays the following types of information about supported core types:

Number of Processors per Core Type

```
$ emon -v
......
total_number_of_processors ...... 22
number_of_online_processors ...... 22
number_of_processors (bigcore) ...... 12
number_of_online_processors (bigcore) ...... 12
number_of_processors (smallcore) ...... 10
number_of_online_processors (smallcore) ...... 10
......
```

Cache Info per Core Type

```
$ emon -v
......
Cache Info (bigcore):
L1 Data Cache ............. 48KB, 12-way, 64-byte line size
              2 HW threads share this cache, No SW Init Required
L1 Code Cache ............. 64KB, 16-way, 64-byte line size
              2 HW threads share this cache, No SW Init Required
L2 Unified Cache ........... 2MB, 16-way, 64-byte lin size
              8 HW threads share this cache, No SW Init Required
64-byte Prefetching

Cache Info (smallcore):
L1 Data Cache ............. 32KB, 8-way, 64-byte line size
              No SW Init Required
L1 Code Cache ............. 64KB, 8-way, 64-byte line size
              No SW Init Required
L2 Unified Cache ........... 2MB, 16-way, 64-byte line size
              8 HW threads share this cache, No SW Init Required
64-byte Prefetching
......
```

Specs and Configurations per Core Type

```
$ emon -v
......
Processor Features (bigcore):
number_of_selectors ...... 8
number_of_var_counters ...... 8
number_of_fixed_ctrs ..... 4
Fixed Counter Events:
counter 0 ................. INST_RETIRED.ANY
counter 1 ................. CPU_CLK_UNHALTED.THREAD

  (MLC Streamer Prefetching) (Enabled)
  (Cores Per Package:  5)
  (Threads Per Package: 10)
  (Threads Per Core:   1)
......
```

The information is displayed per core type with the each PMU name, such as `bigcore` and `smallcore`.

Mapping Core Type to Processors

EMON collects samples for perfmon events only from applicable core types. To understand the collection result, you must first understand the core type to which each processor is mapped.

```
$ emon -v
.......
OS Processor <-> Physical/Logical Mapping
-----------------------------------------
OS Processor      Phys.Package    Core    Logical Processor    Core Type    Module
      0             0           0             0              bigcore       2
      1             0           0             1              bigcore       2
      2             0           0             0              bigcore       3
      3             0           0             1              bigcore       3
      4             0           0             0              bigcore       4
      5             0           0             1              bigcore       4
      6             0           0             0              bigcore       5
      7             0           0             1              bigcore       5
      8             0           0             0              bigcore       6
      9             0           0             1              bigcore       6
      10            0           0             0              bigcore       7
      11            0           0             1              bigcore       7
      12            0           0             0             smallcore      0
      13            0           1             0             smallcore      0
      14            0           2             0             smallcore      0
      15            0           3             0             smallcore      0
      16            0           0             0             smallcore      1
      17            0           1             0             smallcore      1
      18            0           2             0             smallcore      1
      19            0           3             0             smallcore      1
      20            0           0             0             smallcore      8
      21            0           1             0             smallcore      8
.......
```

The output indicates that processors 0-11 are `bigcore` and processors 12-21 are `smallcore`.

When the `tb7` file is generated from the collection, the samples from CPU 0-11 are for `bigcore` and the samples from CPU 12-21 are for `smallcore`.

The `emon -v` command also provides Module ID mapping to the processor if the module exists on the system.

‰ ´ £ ¬ ² — ® £ ¡ § ¤ § ¡ Ÿ ² § - ¬ ±

Each core type has a different perfmon event list. These events can be defined as common events or core-type specific events depends on the number of core types that have these events.

Common Events

There are events supported in multiple core types. Those events are considered as common events and are collected on all applicable processors.

To check the list of supported events per core type for all core types, run this command:

```
emon -1 [pmu name]
```

For example,

```
$ emon -1 bigcore
INST_RETIRED.ANY
INST_RETIRED.PREC_DIST
BR_INST_RETIRED.ALL_BRANCHES
LONGEST_LAT_CACHE.MISS
TLB_FLUSH.DTLB_THREAD
L2_RQSTS.HIT
.......
```

```
$ emon -1 smallcore
INST_RETIRED.ANY
MACHINE_CLEARS.PAGE_FAULT
SERIALIZATION.NON_C01_MS_SCB
BR_INST_RETIRED.ALL_BRANCHES
LONGEST_LAT_CACHE.MISS
ICACHE.MISSES
ICACHE.ACCESSES
.......
```

Events that are found in events lists for both core types are **common events** such as `INST_RETIRED.ANY`,`BR_INST_RETIRED.ALL_BRANCHES`, or `LONGEST_LAT_CATCHE.MISS`.

Core-Type specific events

If the events are applicable only to certain core types, those events are considered as core-type specific events and are collected only on applicable core type processors.

To check the supported event list per core type for all core types, run this command:

```
emon -1 [pmu name]
```

For example,

```
$ emon -1 bigcore
INST_RETIRED.ANY
INST_RETIRED.PREC_DIST
BR_INST_RETIRED.ALL_BRANCHES
```

```
LONGEST_LAT_CACHE.MISS
TLB_FLUSH.DTLB_THREADL2_RQSTS.HIT
.......
```

```
$ emon -1 smallcore
INST_RETIRED.ANY
MACHINE_CLEARS.PAGE_FAULTSERIALIZATION.NON_C01_MS_SCB
BR_INST_RETIRED.ALL_BRANCHES
LONGEST_LAT_CACHE.MISS
ICACHE.MISSESICACHE.ACCESSES
.......
```

Those events which are found only in the event list for a single core type are treated as core-type specific events.

For example, the following events are exclusively `bigcore` events:

- INST_RETIRED.PREC_DIST
- TLB_FLUSH.DTLB_THREAD
- L2_RQSTS.HIT

These events will be collected on `bigcore` processors only.

The following events are `smallcore` events:

- MACHINE_CLEARS_PAGE_FAULT
- SERIALIZATION.NON_C01_MS_SCB
- ICACHE.MISSES
- ICACHE.ACCESSES

These events are collected on `smallcore` processors only.

‰´£¬² ‡-ªª£¡²§-¬

This section describes how you collect common and core-type events.

Collect Common Events

To specify common events from the event list and collect these events using EMON, run:

```
$ emon -C <common events>

for example>
$ emon -C INST_RETIRED.ANY,LONGEST_LAT_CACHE.MISS
```

Check if the events are collected from both core type processors:

```
$ emon -C INST_RETIRED.ANY,LONGEST_LAT_CACHE.MISS
Version Info: private V11.40 Beta (Mar 27 2023 at 08:42:46) Intel(R) microarchitecture code
named Alderlake-S M:151 S:0

INST_RETIRED.ANY        4,839,412,204   178,561,956     733,369 36,966  17,053,653
1,260,235       13,263  1,233,882       7,488,000       407,408 804,195 881,086 60,998
1,381,005       60,710 633,513  26,804  232,446 997,268 13,263  13,263  13,263  13,263  13,263
13,263
LONGEST_LAT_CACHE.MISS  4,839,412,204   272,605 21,938  738     118,055 17,451  82      359,944
5,103   46,944  41,325  74,752  5,061   190,129 2,177   42,230  358     11,468  40,597  30
26     155      69      38      23
==========
```

Because those events are common events across both bigcore and smallcore, counts are collected and displayed for all processors.

Core-Type Specific events Collection

- Bigcore events collection

To specify `bigcore`-specific events from the event list and collect these events using EMON, run:

```
$ emon -C <bigcore events>

for example>
$ emon -C INST_RETIRED.PREC_DIST,TLB_FLUSH.DTLB_THREAD
```

Check if the events are collected only from bigcore processors:

```
$ emon -C INST_RETIRED.PREC_DIST,TLB_FLUSH.DTLB_THREAD
Version Info: private V11.40 Beta (Mar 27 2023 at 08:42:46) Intel(R) microarchitecture code

4,006  3,944    3,827   3,937
==========
```

According to the processor mapping from emon -v output, processor 0 ~ 11 are bigcore and processor 12 ~ 21 are smallcore.

Only smallcore processors 12 ~ 21 display samples and not applicable core type for example bigcore processors 0 ~ 11 here display N/A.

Collect Combination of Common and Core-Type Specific Events

To collect a combination of common events, `bigcore`-specific events, and `smallcore`-specific events, run:

```
$ emon -C <common events, bigcore events, smallcore events>

for example>
$ emon -C
INST_RETIRED.ANY,LONGEST_LAT_CACHE.MISS,INST_RETIRED.PREC_DIST,TLB_FLUSH.DTLB_THREAD,ICACHE.MISSE
S,ICACHE.ACCESSES
```

Check if all events are collected from appropriate processors like below:

```
$ emon -C
INST_RETIRED.ANY,LONGEST_LAT_CACHE.MISS,INST_RETIRED.PREC_DIST,TLB_FLUSH.DTLB_THREAD,ICACHE.MISSE
S,ICACHE.ACCESSES

```

Common events display samples to all relevent core type processors, and core type specific events display samples only on applicable core type processors and display N/A on not-applicable core type processors.

For example, LONGEST_LAT_CACHE.MISS is common event which exists in both bigcore and smallcore, therefore, the samples are displayed on all processors.

And INST_RETIRED.PREC_DIST is bigcore specific event, bigcore processors are 0 ~ 11, the samples are displayed only on bigcore processors 0 ~ 11, and N/A was displayed on smallcore processors 12 ~ 21 which are not-applicable processors to this event.

ICACHE.MISSES is smallcore event, therefore the samples are displayed only on smallcore processors 12 ~ 21 while N/A was displayed on bigcore processors 0 ~ 11.

Collect Combination of Common and Core-Type Specific Events in Spreadsheet Topology Format

The output for same set of events collection in Spreadsheet Topology format can be collected using "-V" option

```

• ¬ ² º - ¢ ³ ¡ ² § - ¬

Intel® Resource Director Technology (Intel® RDT) is a set of monitoring capabilities that you can use to measure shared resource metrics such as L3 cache occupancy in each logical processor.

The Resource Monitoring ID (RMID) is used to monitor the shared resources. The RMID provides a layer of abstraction between the software thread and logical processors. Each software thread is assigned to a unique RMID. The RMID can be assigned to a single logical processor or multiple logical processors (through IA32_PQR_ASSOC_MSR) for monitoring.

“®£°Ÿ²§¬¥ ˜£¡¦¬-ª-¥§£±

The operations of Intel® RDT are governed by two technologies:

Two feature within the monitoring feature set provided are like below:

- **Cache Monitoring Technology (CMT)**: This allows an operating system, hypervisor, or similar system management agent to determine the usage of cache by applications running on the platform. The associated event in EMON is `UNC_CMT_L3_CACHE_OCCUPANCY`.
- **Memory Bandwidth Monitoring (MBM)**: This is used to monitor the bandwidth from one level of the cache hierarchy to the next. The associated event in EMON is `UNC_MBM_TOTAL_EXTERNAL_BW`, `UNC_MBM_LOCAL_EXTERNAL_BW`.

You can find more information about these technologies in Chapter 17.16 of the Intel® Software Developer Manual.

Additionally, EMON provides the RMID association and RDT allocation through these events:

- `UNC_RDT_PQR_ASSOC` - bit 0:9 represents RMID and bit 32:63 represents CLOS
- `UNC_CAT_L2_MASK` - represents L2 cache allocation capacity associated with the COS on each logical processors.
- `UNC_CAT_L3_MASK` - represents L3 cache allocation capacity associated with the COS on each logical processors.

For more information, see these chapters in the Intel® Software Developer Manual:

- Monitoring Resource (RMID) Association - Chapter 17.16.6
- Cache Allocation Technology Architecture - Chapter 17.17.1

_^˜ —³®®-°²•¬¤-°«Ÿ²§-¬

To see support information for Intel RDT on your system, run:

```
emon -v
```

For example,

```
$ emon -v
.......
RDT HW Support:
    L3 Cache Occupancy          : Yes
    Total Memory Bandwidth      : Yes
    Local Memory Bandwidth      : Yes
    L3 Cache Allocation         : Yes
    L2 Cache Allocation         : No
    Highest Available RMID      : 175
    Sample Multiplier           : 90112
    Number of MBA CLOS          : 15

......
```

—³®®-°²£¢ _^˜ ‰´£¬²±

SEP determines the support for each RDT event. To see a list of these events, run:

```
emon -l1 rdt
```

For example,

```
$ emon -1 rdt
UNC_CMT_L3_CACHE_OCCUPANCY
UNC_MBM_TOTAL_EXTERNAL_BW
UNC_MBM_LOCAL_EXTERNAL_BW
UNC_RDT_PQR_ASSOC
UNC_CAT_L2_MASK
UNC_CAT_L3_MASK
```

‡ - ª ª £ ¡ ² – ˆ ˜ ‰ ´ £ ¬ ² ±

To collect RDT events, run:

```
emon -C <RDT Event List>
```

For example,

```
$ emon -C <RDT Event List>

$ emon -C
UNC_CMT_L3_CACHE_OCCUPANCY,UNC_MBM_TOTAL_EXTERNAL_BW,UNC_MBM_LOCAL_EXTERNAL_BW,UNC_RDT_PQR_ASSOC,
UNC_CAT_L2_MASK,UNC_CAT_L3_MASK
```

– ˆ ˜ — ² Ÿ ¬ ¢ Ÿ ª - ¬ £ ‘ - ¢ £

To profile cache usage by hardware core, include the `-rdt-auto-rmid` option. The EMON tool assigns the core ID for each core as the RMID.

```
$ emon -C <RDT Event List> -rdt-auto-rmid
```

• - ¥ ¥ § ¬ ¥ “ ® ² § - ¬ ±

Identifies and extracts the most recent instance of the driver log from the specified uncompressed core dump into the output file. Default output file is `driver_log.dump` if none specified.

```
emon --extract-driver-log ./core.dump
```

“²¦£° “®²§-¬±

[£¶®£°§«£¬²Ÿª

Experimental events are those events that have not been validated in hardware. When used with `emon -1`, all available experimental events are displayed along with regular events. To list experimental along with regular events, use the following command:

```
emon -1 -experimental
```

To run collection on experimental events, use:

```
emon -C "<EVENT1,EVENT2>" -experimental
```

[[®£°[¡®³[²±¡

Display timestamp counter value on each core.

Display EMON output in verbose mode.

‰ ¶ Ÿ « ® ª £ ±

3

This chapter describes the most common EMON use cases.

† Ÿ ± § ¡

This is the most basic EMON command to run a collection.

```
-bash-4.2$ emon -C "CPU_CLK_UNHALTED.REF_TSC"
Version Info: public V10.1.0 (Feb  1 2018 at 10:02:03) Intel(R) Processor code n
amed Skylake M:94 S:0

CPU_CLK_UNHALTED.REF_TSC        6,624,417,122   259,372,748     465,060 1,634,10
4       32,804,440      369,840 23,364,872      1,093,144       106,996
==========
3.000s real
```

If not otherwise specified, EMON will monitor once for an interval of 3 s. To change either the interval length or the number of intervals (or loops), use the `-t` or `-l` options, respectively.

The basic command creates the data output in quiet mode, which means a minimal amount of output. To print out the headers for importing into a spreadsheet, specify the spreadsheet mode with the `-X` flag.

```
-bash-4.2$ emon -C "CPU_CLK_UNHALTED.REF_TSC" -X
Sample  Clocks  CPU_CLK_UNHALTED.REF_TSC[CPU0]  CPU_CLK_UNHALTED.REF_TSC[CPU1] C

6.000s real
```

Assuming a CPU core has four general purpose (GP) counters, the tool can program only four GP events in a single iteration of event collection. The remaining events will be moved into new groups. EMON performs multiple runs for each group. In the following example, the GP event `UOPS_ISSUED.ANY` is scheduled in a second run.

```
-bash-4.2$ emon -C "INST_RETIRED.ANY,BR_INST_RETIRED.ALL_BRANCHES,BR_MISP_RETIRE
D.ALL_BRANCHES,LONGEST_LAT_CACHE.REFERENCE,LONGEST_LAT_CACHE.MISS,UOPS_ISSUED.AN
Y"

The number of events programmed in each group for a device depends on available counters on that device. For example, group 0 could have 4 GP events on a core, 2 GP events per CBO unit, 1 GP event per PCU unit, and so on. In the following example, the first group has 4 GP events on a core and 2 GP events on CBO. The remaining core and CBO events are scheduled in the next group.

This chapter provides helpful tips and troubleshooting guidance.

‹ £ ² ² § ¬ ¥ — ² Ÿ ° ² £ ¢ › § ² ¦ ‰ ‘ “ ’

To get started with EMON:

1. Identify hardware events of interest using `emon -l/-?` options.

   NOTE For details on event descriptions, see Intel® Software Developer's Manual (Intel® SDM) documentation. Events mentioned in the examples in this guide may not work on all platforms since each platform has its own event lists.

2. Identify processor and memory configuration using `emon -v`.
3. Refer to the applicable sections in this document or use `emon -h` to understand the available tool options and example usages.

ˆ § ± ¡ Ÿ ° ¢ £ ¢ ‰ ´ £ ¬ ² ±

The following situations could result in discarded events:

- An event could be discarded if it is not available on the platform. If an event is discarded due to this reason, the event will not be displayed by `emon -l`.
- An event could be discarded if the system does not come with the device types that support the event. For example, if a system does not come with FPGA units, FPGA events would be discarded.
- If it is a private event and needs special access privileges. In such a case, the event will not be displayed by `emon -l`. By using an non-disclosure agreement (NDA) release package, this problem can be resolved.

‰ ¶ ® £ ° § « £ ¬ ² Ÿ ª ‰ ´ £ ¬ ² ±

Some events are available as experimental events if they are not verified in the hardware. These events are not displayed by `emon -l`. To get event list along with available experimental events use, `emon -l -experimental` or `emon -l -all`. To collect data on experimental events, use `emon -C -experimental`.

ˆ £ ® ° £ ¡ Ÿ ² £ ¢ ‰ ´ £ ¬ ² ±

Certain events are marked deprecated by the tool. EMON will stop supporting deprecated events in future product releases. The tool provides replacement suggestions in place of deprecated events. To obtain a list of deprecated events, use `emon -?` and look for "deprecated" string.
